#### Catalog No. DE303-03

## NDV DIAPHRAGM VALVE

NIPPON DAIYA VALVE CO., LTD.

## **INTRODUCTION OF PRODUCTS**

#### Weir Type Diaphragm Valve (Basic type: Type 400)

#### Manually Operated Diaphragm Valve: Type 400

Nominal Size(DN):15-300

Nominal Size (DN):15-150

PO…Reverse Acting(Air to Open)

PC…Direct Acting(Air to Close)

PN…Double Acting

Pneumatically Operated ON-OFF Diaphragm Valve: Type PO(PC, PN) 1400N

Pneumatically Operated Flow Control Diaphragm Valve (1): Type 3400 [Rolling diaphragm type]

Nominal Size (DN):100-300

HC…Direct Acting(Air to Close)

HN…Double Acting

Large and high output type

Pneumatically Operated Flow Control Diaphragm Valve (2): Type HN3400N [Cylinder type]

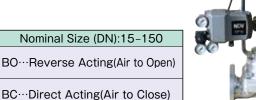

Nominal Size (DN):150-300 HN…Double Acting

Large and high output type

Electrically Operated Diaphragm Valve (2): Type NR4400

Nominal Size (DN): 15-80

Electrically Operated Diaphragm Valve (1): Type MS4400

Nominal Size (DN): 25-300

Photos in this catalog represent images of valves. Actual appearance may differ by specifications.

#### Straight Type Diaphragm Valve (Basic type: Type 500)

Manually Operated Diaphragm Valve: Type 500

Nominal Size (DN): 15 - 300

Nominal Size (DN): 15 -100

PO…Reverse Acting(Air to Open)

PN…Double Acting

Pneumatically Operated ON-OFF Diaphragm Valve: Type PO(PN) 1500N Pneumatically Operated ON-OFF Diaphragm Valve: Type HOT (HN) 1500N

Nominal Size (DN): 125 - 300

HOT…Reverse Acting(Air to Open)

HN…Double Acting

•Large and high output type

Electrically Operated Diaphragm Valve (1): Type MS4500 Nominal Size (DN): 25 - 300

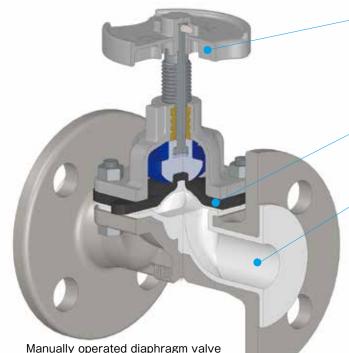

For the product specifications and details, contact our Sales Dept. or local representative.

### **OVERVIEW OF DIAPHRAGM VALVES**

#### **1** Basic Structure and Mechanism of Diaphragm Valves

- Diaphragm valve generally refers to a valve having a diaphragm of rubber or other flexible material that opens or closes the fluid passage.
- •The following diagram shows the basic structure of diaphragm valve that consists of three units, actuator, diaphragm and the body. The valve controls the liquid flow by pressing or depressing the diaphragm to or from the sealing surface on the inside of the body.
- Diaphragm valves are roughly categorized to two types; Weir type (Type 400) and Straight type (Type 500), but both types share the same basic structure.

#### Basic unit structure

#### Actuator

Mainly categorized into the manually operated type, pneumatically operated type, flow control type(\*) and electrically operated type.

#### Diaphragm

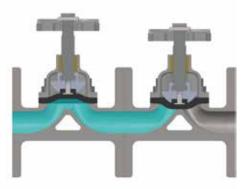

Rubber, fluorine resin(\*) and other material are available according to application(\*\*).

#### Body

Metal with or without lining is available in rich selection for a body. Connection method available includes welded type and screw type in addition to the flange type(\*\*). (\*) For weir type diaphragm valve only. (\*\*) For details, see p.10 and p.15

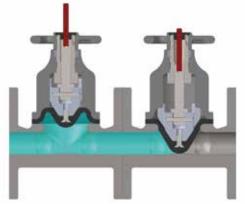

Manually operated diaphragm valve (fluorine resin-lined)

#### Weir type diaphragm valve: Type 400

- Basic structure of diaphragm valve having a weir at the fluid passage. The diaphragm and weir of the body are tightly closed for airtightness to achieve high valve seat sealing performance.
- Rich selection is available for the main body and diaphragm material to apply to a wide scope of fluid.
- Used for : Chemical, environment and water treatment, iron and steel, shipbuilding, medical, food, semiconductor, power generation, etc.

Straight type diaphragm valve: Type 500

- The fluid passage is straight, which minimizes pressure drop and/or fluid accumulation.
- Applicable to viscose fluid, cellulose fluid, slurry, sledge and other fluids containing suspended solids.
- Used for: Water purifying plants, terminal treatment plant, etc.

#### $(\mathbf{2})$ Features of Diaphragm Valves

#### OSuperb airtightness

· Actuator is isolated by the diaphragm. This prevents fluid leakage to outside or contamination of fluid by outside air.

#### 2 Zero leak from valve seat

- · Controlled by flexible diaphragm, no fluid leaks from the valve seat.
- In the case of rubber diaphragm, complete closing is available, even if some foreign matters are bitten into diaphragm due to its flexibility.

#### **3** Superb corrosion and chemical resistance

- · Simple body shape is suitable for the lining proess.
- · Combination of rich selection of diaphragm material and various lining bodies such as rubber and fluorine resin allows manufacture of valves applicable to a wide span of fluid specifications, which is more efficient costwise than special alloy combination.

#### 4 Good self-purifying performance

· Streamlined fluid passage without pockets provides self-purifying performance by minimizing fluid retention.

#### Superb maintainability

- Simple design of three parts. Actuator. Diaphragm and the Body makes it easy to disassemble/assemble the valve.
- Top entry structure adopted enables to change diaphragm by simply removing the nuts and bolts that joint the main body and the bonnet without disconnecting the valve from the piping.
- · Each unit is interchangeable, enabling a system change with ease from manual to automatic operation.

#### 6 Environment-friendly types

· Simple 3-unit construction of the Actuator, Diaphragm and the Body requires less number of parts than other valve types, saving consumable parts.

Environment-friendly type paint and lubricant free from hazardous heavy metal are used. (RoHS compliance)

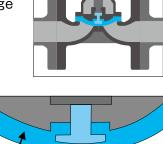

Actuator for the pneumatically operated diaphragm valve is improved to have much higher durability, extending the replacement cycle for expendable parts.

Chloroprene diaphragm is lead-free.

Improved actuator for the pneumatically operated diaphragm valve has reduced air consumption. (Approx. 20% in average from the conventional products of ours.)

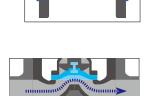

Solenoid valve to the pneumatically operated actuator can be installed directly without pneumatic piping, thus reducing material usage.

Type POM1400N

## ELECTRICALLY OPERATED DIAPHRAGM VALVE

#### 4-1. Specifications of Electrically Operated Valve

① MS type: Seibu Electric & Machinery Model

② NR type: Nihon KOSO Model

#### 4-2. Weir Type Diaphragm Valve: Type MS(NR)4400

① Actuator selection table

② Principal dimensions

#### 4-3. Straight Type Diaphragm Valve: Type MS(NR)4500

① Actuator selection table

② Principal dimensions

#### Features

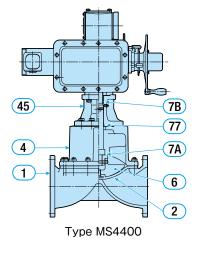

①Widely used by the govenment office for water treatment facilities and for power plants.
②Manual return type is the standard for safety purpose.
③Rich selection of accessories (motor with the brake, electric positioner, etc.)

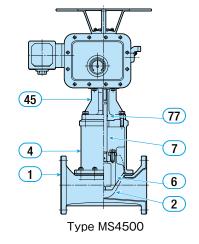

(Control valve is also available in addition to the ON-OFF valve.

#### Standard Specifications

| H1,H2   | Space heater terminals                                             |
| U,V,W   | Motor terminals                                                    |

Limitorque (Nippon Gear), Rotork (Shimadzu) and other electrically operated machines are installable in addition to MS type and NR type above. For the details, contact our Sales Dept. or local representative.

EFERENCE

#### (2) NR type: Nihon KOSO Model

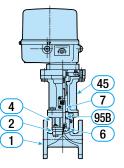

#### Features

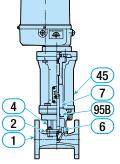

Compact motor-operated machine for small bore valve.
 Operable with a single-phase power supply
 Economical as it consumes only little power compared with MS type.
 Valve open-close operation with a single select switch.
 Control valve is also available in addition to the ON-OFF valve.

#### Internal Connection Diagram

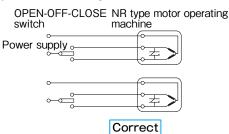

| U-X     | Turn to CCW direction (OPEN direction)                           |
|---------|------------------------------------------------------------------|
| V-X     | Turn to CW direction (CLOSE direction)                           |
| 7-10    | ON at hinged end of CCW (fully open position)                    |
| 9-10    | ON at hinged end of CW (fully closed position)                   |
| TP      | Thermal protector                                                |
| SH      | Space heater (optional)                                          |
| LS3,LS4 | Limit switch can be set for activation at an arbitrary position. |

Turning direction is as viewed from the top of the operating machine. The diagram shows a hinged end at CW (fully closed position.)

If the 2 units of electric operating machines are simultaneously operated with the wiring as shown in the lower left-hand corner, a detour circuit is established through the capacitor leading to abnormal operation. Always arrange for the operating switches separately as shown to the right.

## **INTRODUCTION OF RELATED PRODUCTS**

### **INTRODUCTION OF RELATED PRODUCTS**

#### (1) Gauge Valve type: Type 400G

- Liquid level inspection valve using the structure and features of weir type diaphragm valve.
- Main body made of lining material (hard natural rubber, glass, etc.) is corrosive liquid resistant.
- Applicable nominal size: DN20

#### 2 Rubber-lined Check Valve

- Check valve with rubber lining material is manufactured using technology for rubber lining processing.
- Sealing system for DN15 80 is a ball type valve body and DN100 and 150 a swing type valve body.
- This valve is exclusively for a vertical piping. (Swing type valve body is applicable to level installation as well.)

#### **3** Bioclean Diaphragm Valve series

- Valves of optimal sanitary specifications are available for the production lines of pharmaceutical, cosmetic, food, semiconductor and other industries.
   Bioclean Diaphragm Valve series most utilize the advantages of diaphragm valve structure that "contaminates no fluid and
- provides superb self-purifying performance."
  For more details, please refer to our Sanitary-related Valve Product Guide.

Order made system available to develop products meet customers' need; Inquire us for other options for actuators, special shaped body, special material products, etc.

#### Flange type

#### 1. Flange standard:

The above standard comply with JIS B2220 (steel pipe flange with nominal pressure of 10K). The flange thickness t shall comply with BS10 Part 2-TABLE D (British Standard Class D).

#### 2. The flange thickness t shall be classified as follows :

FC: Gray casting, ductile steel casting

Other than FC: Steel casting, stainless steel casting, and bronze casting

#### 3. Packing face:

Standard face shall be flat face. The above table shall apply to stainless steel casting, particularly when raised face is specified. The standard of this company shall apply to ETFE-, PFA-, and glass-lined material for the main body that constitute a raised face from their manufacturing method.

#### 4. Other Standers:

We also manufacture flanges under other standards such as ANSI Class 125/150. Standards of Japan Water Works Association, DIN PN10/16. The thickness of flanges shall be all as per above-mentioned table. (Depending on body materials, either of ANSI Standard Class 125 or 150 is applied, but the both flange bolt hole pattern is same.)

#### 5. Face-to-face dimension:

Complies with ISO 5752.

#### 6. Bolt and nut:

Because of narrow space for the hexagon piping nut on the back of the flange of nominal size DN15 – 80, use of continuous-thread stud and hexagonal nut of JIS Standard (8-slit nut) is recommended.

#### 2 Special specifications: Nameplate, Painting, Photography and Witness inspection

#### 1. Nameplate:

Nameplates indicating the valve name and other special naming are available by option.

#### 2. Painting:

Standard painting shall be as follows:

Manually operated valves: Rust resistant paint (Gray) without top coating Automatically operated valves (pneumatic and electric): Rust resistant paint and silver top paint For special coating, please specify details for separate estimate.

#### 3. Photography:

Photography is available by option.

#### 4. Witness inspection:

Witness inspection by inspection agency is option.

## PNEUMATICALLY OPERATED ON-OFF DIAPHRAGM VALVES

Actuator code: None

Nominal size: DN25

Diaphragm: Chloroprene

Standard handwheel type: None

 $\cdot$  Example for a pneumatically operated ON-OFF valve

With the opening indicator

Weir type diaphragm valve

Manually operated valve: None

The above-mentioned product codes represent the standard system. A separate code number may be given to a product manufactured according to requested specifications. For any question on the detail of product coding, contact our Sales Dept. or local representative.

REFERENCE MATERIALS

#### (4) Material Selection Table

This valve selection table outlines typical reference materials based on our tests and rich performance data. (The following table represents excerpts of reference materials. For application under other fluid, concentration, temperature and other conditions than stated in the table, please contact our Sales Dept. or local representative.) Material evaluation symbol

#### [Note]

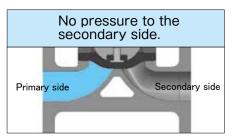

• This table is applicable only for the diaphragm valve materials used by our company. The data is not applicable to composite chemical solution. For specific chemicals, contact our Sales Dept. or local representative.

• Rubber-lined bodies are not applicable to by-product hydrochloric acid (hydrochloric acid obtained as a by-product in the manufacturing process of chloromethane, chloroform, vinyl chloride, trichloroethylene and chlorobenzene). Bodies with ETFE or PFA lining are recommended.

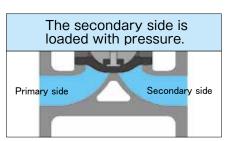

#### **5** Actuator Selection Table

Fluid pressure stated in the actuator selection table in this catalog represents the pressure to the primary side when no pressure is applied to the secondary side (atmospheric pressure). If the secondary side is loaded with the pressure when the valve is closed, a greater output may be required. In such a case, please contact our Business Dept.

Use the selection table in this catalog.

Contact us as correction is required.

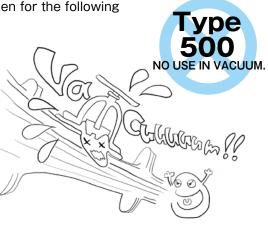

# 7 SAFETY INSTRUCTIONS

## SAFETY INSTRUCTIONS

#### Cautions for selecting the valve

- ①Products described in this catalog have respective range of application specified according to the official standards and our own standard. Customers are requested to check on your conditions for usage (fluid, pressure, temperature, etc.) before selecting an optimum product.
- ②Select the material for the main body (lining), diaphragm, bonnet, compressor, base and other depending on the fluid you are to handle. As to the materials for the main body (lining) and diaphragm, please refer to the material selection table in the catalog or contact us. Please note that certain types and sizes of bonnet, compressor, base, etc. are standard manufactured using aluminum alloy. Optionally these products are also manufactured using steel material (FC200, SCS13, etc). When handling some liquid that erodes aluminum alloy, using steel material is recommended for the sake of safety. Please discuss this matter when placing orders.
- ③When using Type 500 (Straight type), care should be taken for the following matters due to valve characteristics:
  - (1)Avoid using it in a vacuum environment.
  - (2)Avoid controlling it or using it with the opening set to intermediate level.
  - (3)Avoid using it for handling a fluid of 70°C or over continuously with the valve fully open.
  - (4)Avoid using it with the valve fully closed at a discharge side of a pump for example where high pressure or pulsation is momentarily loaded.
  - (5) Avoid using it for an abrasive fluid with the valve almost fully closed.

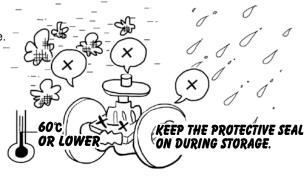

#### 2 Cautions at Receiving and during Delivery

- ① Upon receipt of valves, check that the product and quantity are as ordered. Also check if the package and packing are undamaged.
- ② Certain items weigh heavy. When unloading or delivering the product, mind the safety by using an appropriate hoisting machines, etc. in conformity to Occupational Safety and Health Act or equivalent law. Never enter directly below a hoisted product package or operate the hoist from under the raised package.
- ③ If wetted, cardboard boxes may lose packing strength. In such a case, handle them with utmost care.
- ④ When handling a main body with the lining of hard rubber or glass lining or ceramic body, handle carefully and protect it from a strong impact or the lining may be damaged.

#### **3** Cautions for Storage

- ① Users are recommended to keep the product in packed state until starting installation to the piping.
- (2) When storing the valve in unpacked condition for a period of time, always keep the protective seal (a cap) on to the face of the flange for piping.
- ③ To prevent the valve from rust or rubber and plastic material from degradation, store the valve in the following conditions:
  - (1)Keep away from the rainwater.
  - (2)Keep away from direct sunlight.
  - (3)Keep it at the ambient temperature of 60°C or lower.
  - (4)Keep away from high humidity and dusty atmosphere.

52

ATED PRODUCT:

#### 4 Cautions for Installation to the Piping

- ① Remove the protective seal (a cap) from the connecting flange face of the main body. Check the inside of the valve for any contamination or attachment of foreign matters. Also check the piping system to connect the valve to for cleanliness and any foreign matters. Apply a gas blowing or liquid flushing as may be needed. Foreign matters inside the valve if any may cause leakage when caught between the valve base of the main body and the diaphragm.
- ② Provide a space around the valve necessary for overhauling. Such a space should allow to replace the diaphragm with the main body remaining connected to the piping. Particularly, when hoisting the bonnet, necessary space must be provided for the hoisting operation.
- ③ When installing the value to the piping, prevent it from receiving abnormal tension, compression or bending stress.
- ④ In the case of a flat face flange, use a gasket that fully covers the flange face. If a soft rubber-lined body is covered with a gasket that fails to cover the flange face completely, the lining may be damaged or leakage may occur.
- (5) Use rubber gasket to the rubber-lined main body.
- (6) For connection to the piping, use the bolts of a length that makes no contact with the bonnet flange or use continuous thread studs and adjust the length of the protruding head of the stud. Tightening the bolt in contact with the bonnet flange may cause external leakage or damage the bonnet, causing the valve failure.

Particular care is required to the contact of the bonnet flange with the piping bolt when installing a valve of DN15 to 80 to the piping.

Users are recommended to use a double-end stud for the piping bolt and the nut of Style 1 (JIS B 1181), Class 1 or 2 (JIS B 1181 Attachment 1). Make adjustment to prevent contact between the bonnet flange and the piping bolts.

Adjustment position should read a position where the end face of the bolt is flush with the end face of the nut. (Select a bolt so that the fit length of the thread will be definitely at least 80% or higher of the height of the nut.)

- ⑦ When installing the valve to the piping, tighten individual bolts alternately and diagonally under identical torque. Unevenly clamped bolts may cause leakage from the connecting flange face.
- (8) Products with the air vent port (manually operated valve of DN125 and over, pneumatically operated valve and electrically operated valve) should be protected from the entry of rainwater, etc. through the port.
- ③ When connecting the valve with welded joint, always remove the bonnet including the diaphragm from the main body before welding. Reinstall the bonnet and all including the diaphragm after the temperature of the welded portions reaches the normal temperature.
- 1 Care should be given to the following points for wiring:
  - (1)Before closing the switch cover, make sure that the gasket is perfectly applied and the mating face is cleaned. Close the switch cover by tightening the mounting bolts steadily.
    (2)Outlet port for the outside lead wire should be made
  - rainwater-proof.
  - (3)Always keep the switch cover closed.

(4)Positively never carry on outdoor wiring work in the rain. (5)After making wire connection, always check operation.

#### 5 Cautions for Machine Operation

- ① Opening/closing the valve with part of an operator's body or wear carelessly in contact with the moving parts inside or outside of the valve may lead to a serious injuries. Never touch the inside or moving parts of the valve.
- <sup>(2)</sup> When opening/closing the valve, don't operate the handwheel by hooking an auxiliary pipe or wrench on it. Or an excessive load will be applied to the valve component possibly to damage it.
- ③ When operating the handwheel to close the valve, stop the closing operation at maximum 15 to 20 degrees after sensing the valve resistance to the closing motion. Excessive tightening may cause a shorter diaphragm life. Particular care is required when han-
- dling a fluid in high temperature.
  If the handwheel operation is felt heavier in the middle of a valve closing operation, certain foreign matters might have been caught with the valve seat. In such a case, open the valve once, let the fluid flow through, and check if the foreign matters are washed away, then start the closing operation again.
- (5) If ambient temperature or fluid temperature changes greatly while the fluid is sealed inside the piping, thermal expansion of the fluid causes the pressure to change, possibly leading to external leakage or damaged diaphragm.

ISTRUCTIONS

## SAFETY INSTRUCTIONS

In addition, if the valve is operated to open/close while the valves before and after the diaphragm valve are closed and the inside fully filled with the fluid, the same phenomenon may occur, for which care should be taken.

- <sup>(6)</sup> If the fluid fully inside the valve is frozen, the valve may be freeze-fractured. For application in an environment where freezing may likely happen, take anti-freeze measures by providing the piping with thermal insulation or if the valve is not in use, to extract liquid from inside the valve, etc.
- ⑦ Rubber is used for the material of diaphragm. The nuts that clamp the diaphragm may be loosened due to vibration during transportation or stress relaxation after a long period of operation. In such a case, render the diaphragm unloaded by nullifying the fluid pressure, then apply prescribed torque to tighten the nuts to the required level.

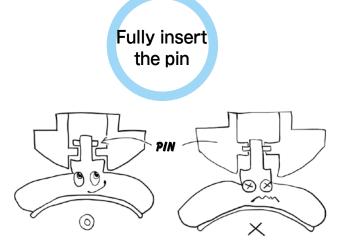

#### 6 Cautions for the Actuators of Pneumatically, Electrically Operated Valve

- ① Protective sealing (cap) is provided to the air intake port and the electric wiring connection port. Don't remove the sealing (cap) until the connection joint is installed.
- ② Actuators are shipped factory-adjusted. Don't disassemble and reassemble them. If any adjustment is required, please contact us.
- 3 Dehumidify the air and filter it clean before leading to the valve for application.
- ④ For the operating pressure and power supply, see the nameplate or the specifications of delivered product.
- 5 Protect the products with the air vent port against the entry of rainwater.

#### Cautions for Disassembly and Assembly

This is general information. Do not disassemble before you read necessary manual in details.

- ① When removing or disassembling the valve, ensure the following matters or you may be risking a serious hazard:
  - $\ensuremath{(1)}\xspace{The object}$  value should have been separated from other piping.
  - (2)The fluid pressure and temperature inside the piping and the valve should be atmospheric and normal.
  - (3)There remains no residual fluid inside the piping, and no fluid leakage occurs when the mounting bolts and nuts are loosened.
- O Provide maintenance work for the diaphragm and actuator periodically.
  - (1)Rubber diaphragm is screwed in. When mounting to the compressor, apply appropriate pressure to screw it in. Slightly bring it back from where it stopped to align the bolt hole positions.
  - <sup>(2)</sup>PTFE diaphragm is of a bayonet type. To install to the compressor, push the center of a diaphragm firmly with fingertips. Ensure that the pin has fully entered the compressor before turning it 90 degrees clockwise or counterclockwise.
  - In the case of a reverse seat type diaphragm, turn it over before installation. Turning the diaphragm before the pin fully enters the compressor may damage the pin.
  - (3)When reassembling to the valve, run centering, and tighten the bolts and nuts evenly by applying prescribed torque.
  - (4)For detailed maintenance instructions, see the instruction manual or contact our Sales Dept. or local representative.

• The ISO 9001.14001 certificate was awarded

Specifications and performance figures of products contained in this catalog are based on the design calculations, in-house tests, actual records of product application, and the official standards and specifications. They are presented as the user guide on the use of product concerned under general service conditions. Users intending to use the product under a special condition are required to receive engineering advice from this company in advance or to make their own studies and evaluation to verify performance on their own responsibility. This company shall not be liable for any damages, material or human, that may arise without following this procedure. Inasmuch as full care was taken in editing this catalog, users are kindly requested to make contact with this company for any questions or discrepancies found. This catalog is subject to change without notice for the purpose of correcting error, supplementing or improving insufficient content, updating the content to the improved product performance, design change, discontinuation of product and other reasons. Revised version automatically invalidates catalogs issued prior to the current version. Check the version with our Sales Dept. or local representative before you place orders.

There are some instructions for use of diaphragm valve because of a constructional characteristic. When valve is delivered, the leaflet related to instruction on Safety is bundled. Please read this instruction thoroughly before beginning of use and handling to use your product safely and stably for a prolonged life.
