WHO ARE WE

TALIS is a leading global provider of premium valves, hydrants and other solutions for water flow control.

With a varied range of products, we offer comprehensive solutions for the entire water cycle, from hydrants to butterfly valves, from knife-gate valves to needle valves. Our experience, innovative technology, global expertise and individual consultation process, form the basis for developing sustainable solutions for the efficient handling of the vital resource "water".

With over nine strong brands and 28 entities in Germany, France, Spain, Portugal, Italy, Great Britain, the Netherlands, Russia, Poland, Israel, China, the Middle East, Mexico, India, South Africa, Kazakhstan, Peru and Brazil, TALIS is the largest supplier of valve technology and first choice when it comes down to water valves and services for the whole water cycle.

OUR VISION OF

SUSTAINABLE DEVELOPMENT

There is not enough water to go round, and yet it is one of our most essential resources.

At TALIS we strive to develop highly reliable solutions incorporating the smartest technologies available to improve network performance and save water resources. Beyond this commitment to the excellence of our products, we are also responsible for upholding the highest standards with regard to safety and respect for people and the environment.

This is how we can make the world a better place.

THE QUALITY AND SUSTAINABILITY OF OUR PRODUCTS CHARACTERIZES OUR OFFER. IT COMES DOWN TO MAKING CHOICES.

Choices with respect to materials used, the quality of components and their impact on the environment. Beyond design however, it is above all a question of effectiveness when it comes to protecting water resources.

We make sustainable products, but first and foremost we assist our customers in improving their own practices in terms of water management, from catchment to the release of treated effluents. »

Christophe Busson
TALIS Marketing Technical Leader

In all its activities, TALIS is committed to being a good employer, neighbour and a fair business partner:

□ ISO 14001 certified (environmental management)

- ☐ DIN ISO 50001 certified (the company's energy performance)
- □ Active participation in water focused NGO
- □ Participant since 2012 (BELGICAST) of United Nations Global Compact

PROVIDING SUSTAINABLE PRODUCTS

Our valve solutions facilitate highest customer benefit whilst being uncompromising in terms of product safety and sustainability.

- ☐ High efficiency products with lower pressure drop limiting energy needs
- Addressing the global issue of water shortage with products reducing water leakage

WORKING FOR HEALTH AND SAFETY

Health and safety of our employees and stakeholders is high priority at TALIS.

- Group wide health and safety policy deployed globally
- ☐ Proactive detection and elimination of potential risks
- 0 % accident policy
- □ Continuous improvement of working conditions at all of our sites

WORKING WITH A COMPLIANCE CULTURE

Business Integrity as company culture.

- □ E-Learning on compliance mandatory for all employees
- Compliance officer at group level

We achieve results by bringing together teams of experts and specialists who travel and encourage the acquisition of knowledge by all stakeholders and interested parties.

We establish research programs to accelerate progress in R&D. We enhance the technical expertise of our employees and customers in the various product ranges we offer, while encouraging networking between specialists and our own customers.

LONG-TERM SUPPORT

BEFORE SALES

- □ Specification
- □ Custom solutions
- □ Design
- □ Technical studies

AFTER SALES

- □ Commissioning
- □ Technical assistance

- ☐ Asset management
- □ Spare parts

WE

share and cultivate trust, respect for transparency and honesty in all our actions worldwide.

YOU

are our customers, our partners, the inspiration behind our innovations and the drivers of our performance.

(

TOGETHER

we develop and support the talent that invents and deploys cuttingedge solutions, with a view to improving quality of life for all.

THE TALIS ACADEMY Available to our employees and customers to help them grow their knowledge and improve the

customers to help them grow their knowledge and improve their command of our products, TALIS ACADEMY offers comprehensive theoretical and practical training solutions.

On-site: training at the client's premises with a mobile bench dedicated to hydraulic control valves, or using the client's own equipment.

Our programmes are run by various trainers and specialists. For example, the TALIS ACADEMY offer training measures in areas including security and control valves, isolation valves, couplings and fittings, hydrants.

To become the first truly global leader in water flow control solutions, WE PROVIDE CUSTOMER BENEFIT WITH A HIGHER QUALITY OF SERVICE, shorter response times and a better understanding of local needs and best-in-class sales processes. »

TECHNICAL DATA

Water, Brackish water, Sea water, Foam

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

PPROVALS

ADVANTAGES

- Only three parts: body, diaphragm & cover plate. No wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line with only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, testing and maintenance standard of water-based fire protection systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The trip is actuated by an electric signal transmitted to the valve's solenoid from the main control panel, due to a flame heat exposure of a sensors detection system
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges

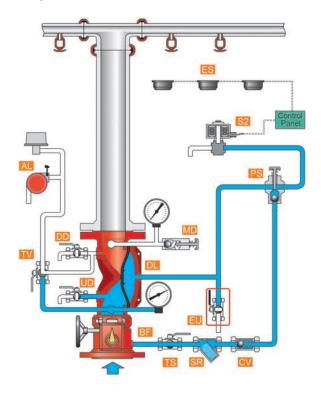

The FDV-DEO resets to stand-by close position by pressurizing the Dry Pilot Line and manually operating the PSA device.

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the closed PSA (PA), the closed 2 way solenoid valve (S2) and by the closed emergency valve (EU), maintaining the FDV deluge valve (DL) closed.

FIRE situation

When an electric detection system senses flame heat, it triggers the main control panel that in turn,transmits an electric signal, commanding the 2 way solenoid valve (S2) to open and drain the deluge valve's control chamber. The FDV Deluge valve opens and admits water to the spray sprinklers line.

RESET position

System reset requires the reset of the electrical alarm system to de-energize and close the solenoid valve, not allowing the FDV control chamber to drain. The PSA (PS) push button should be pressed to enable upstream pressure passage to close the FDV main valve.

Deluge Systems

Pneumatic Actuated with Local Reset Deluge Valve

FDV - DP0

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DPO Deluge system is actuated pneumatically and resets locally.

When the pneumatic dry pilot detection line is exposed to flame heat, its automatic fire sprinklers shatter-open, while venting the air pressure from the FDV-DP0's actuator, commanding the deluge valve to open.

The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DPO valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

EU - Emergency Manual Unit

PC - PA-PTC - Pneumatic Actuator-Pressure to Close

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the closed PSA (PA), the closed PA-PTC actuator (PC) and by the closed emergency valve (EU), maintaining the FDV Deluge valve (DL) closed.

FIRE situation

When some of the Dry Pilot detection line's automatic fire sprinklers are subjected to flames heat and shatter-open, the pilot detection line depressurizes the PA-PTC control chamber. The PA-PTC (PC) opens and drains the deluge valve's control chamber.

The FDV deluge valve opens and admits water to the spray sprinklers line.

RESET position

System reset requires the replacement of all the Dry Pilot detection Line's shattered-open automatic fire sprinklers. The detection line is then pressurizing together with the PA-PTC actuator, to reset it to closed position.

The PSA (PS) push button should be pressed to enable the control chamber filling, closing the FDV deluge valve.

Deluge systems

Pneumatic Actuated with Remote Reset Deluge Valve

FDV - DP1

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DP1 Deluge system is actuated pneumatically and resets remotely.

When the pneumatic dry pilot detection line is exposed to flame heat, its automatic fire sprinklers shatter-open, venting the air pressure from the FDV-DP1's actuator, commanding the deluge valve to open. The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DP1 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

TECHNICAL DATA

FI IIID-

Water, Brackish water, Sea water, Foam

PNEUMATICS:

Air, Nitrogen

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of waterbased Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flow rates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by a Dry Pilot Line's pneumatic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges

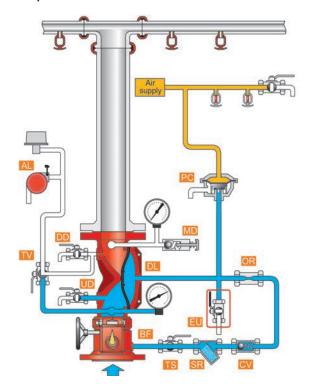

The FDV-DP1 resets to stand-by close position by pressurizing the Dry Pilot.

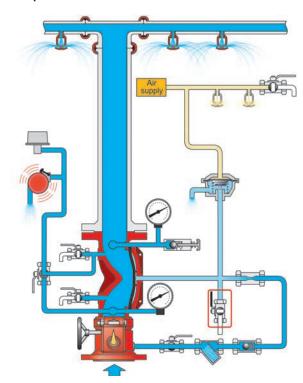

Schematic drawing

Fire position

- BF Butterfly valve
- **DL** FDV Deluge valve
- **UD** Upstream drain valve
- DD Downstream drain valve
- AL Acoustic & Electric alarms
- **TS** Trim supply valve
- SR "Y" strainer
- CV Check valve

- **OR** Orifice
- MD MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the check valve (CV), the closed emergency valve (EU) and by the closed automatic Wet Pilot Line sprinklers. The hydraulic pressure accumulated in the Wet pilot detection line maintains the FDV deluge valve (DL) closed.

FIRE situation

When the Wet pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, it enables the FDV control chamber to drain and de-pressurize, opening of the deluge valve and admitting water into the spray sprinkler system. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

RESET position

When the Wet pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, it enables the FDV control chamber to drain and de-pressurize, opening of the deluge valve and admitting water into the spray sprinkler system. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

Deluge systems

Electric-Pneumatic Actuated with Local Reset Deluge Valve

FDV - DC0

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DC0 Deluge system is actuated electrically or pneumatically and resets locally.

Two detection systems, can independently activate an actuator to open the deluge valve: a pneumatic Dry Pilot detection Line and/or an electric solenoid, connected to sensors through a control Panel. The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DC0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing service valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the main valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm

Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by an electric signal conveyed to the valve's solenoid or by Dry Pilot Line's pneumatic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges

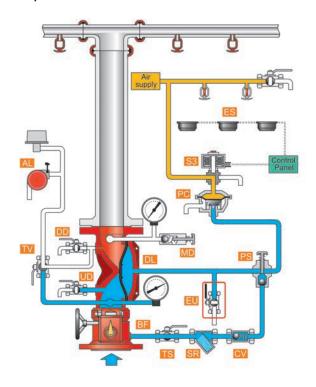

The FDV-DC0 resets to stand-by close position by de-energizing the alarm system solenoid's coil through the main control panel or, pressurizing the Dry Pilot Line and manually operating the PSA device.

- CV Check valve

- PS PSA Pressure Supply Arrestor
- MD MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit
- PC PA-PTC Pneumatic Actuator-Pressure to Close
- S3 Solenoid 3 way

OPERATION

SET position

Pressurized water in the valve's control chamber is trapped by the check-valve (5), by the closed PA-PTC actuator (9) and by the closed emergency valve (8), maintaining the deluge valve in its closed position.

The air pressure accumulated in the Dry pilot Detection line is conveyed to the PA-PTC actuator, through a 3 way solenoid valve, maintaining the Deluge valve closed.

FIRE situation

When some of the Wet pilot detection line's automatic fire sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot line de-pressurizes, tripping open the PA-PTC. Alternatively, an electric detection system senses heat and triggers the main control board that in turn, energizes the 3 way solenoid valve.

The solenoid valve bypasses the Dry pilot detection line depressurizing the PA-PTC. The FDV-DC0's control chamber is then drains and the Deluge valve opens.

RESET position

System reset requires the replacement of all Shattered-open Fire sprinklers in the Detection pilot line. Alternatively, the electrical alarm system has to be reset and the solenoid de-energized. Resetting both Detection line and solenoid valve, the PA-PTC actuator pressurizes and closes the FDV deluge valve.

- **PC** PTC Pneumatic Actuator-Pressure To Close
- S3 Solenoid 3 way

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by check valve (CV), the closed PA-PTC actuator (PC) and by the closed emergency valve (EU), maintaining the deluge valve in closed position. The air pressure accumulated in the Dry pilot Detection line is conveyed to the PA-PTC actuator, through a 3 way solenoid (S3) valve, maintaining the Deluge valve closed.

FIRE situation

When some of the Wet pilot detection line's automatic fire sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot line de-pressurizes, tripping open the PA-PTC. Alternatively, an electric detection system senses heat and triggers the main control board that in turn, energizes the 3 way solenoid valve. The solenoid valve bypasses the Dry pilot detection line depressurizing the PA-PTC. The FDV-DC0's control chamber is then drains and the Deluge valve opens.

RESET position

System reset requires the replacement of all shattered-open fire sprinklers in the Detection pilot line. Alternatively, the electrical alarm system has to be reset and the solenoid de-energized. By this, the PA-PTC actuator pressurizes and closes the FDV deluge valve's drain. Upstream water passing through the orifice (OR), pressurizes the FDV Deluge control chamber and the valve closes.

Deluge Systems

Hydraulic Actuated, Local reset Deluge Valve

FDV - DHO

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DH0 Deluge system is actuated hydraulicaly and

When a hydraulic detection system, a Wet Pilot detection line, is exposed to a predetermined temperature level, its automatic fire sprinklers shatter open and commanding the FDV-DH0 deluge valve to open.

The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DHO valve features a direct elastomeric diaphragm Seal. It has No balancing spring or internal metallic wet components in the valve

The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

MARKETS

Commercial

ADVANTAGES

- Only three parts: body, diaphragm & cover plate. No wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line with only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, testing and maintenance standard of water-based fire protection systems, NFPA 25

TECHNICAL DATA

Water, Brackish water, Sea water, Foam

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

PPROVALS

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flow rates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The trip is actuated by a Wet Pilot Line's hydraulic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source to prevent surges

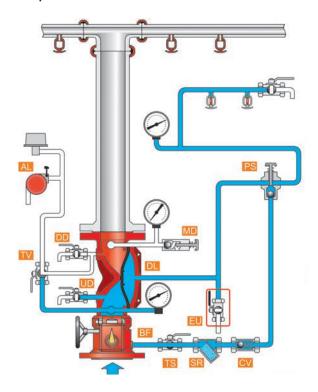

The FDV-DH0 resets to stand-by close position by pressurizing the Dry Pilot Line and manually operating the PSA device.

AL - Acoustic & Electric alarms

TS - Trim supply valve

SR - "Y" strainer

CV - Check valve

PS - PSA - Pressure Supply Arrestor

MD - MADV - Man/Auto Drain Valve

TV - Alarm test valve

EU - Emergency Manual Unit

OPERATION

SET position

Pressurized water in the valve's control chamber [DL] is trapped by the closed PSA [PA], the closed emergency valve [EU] and by the closed automatic Wet Pilot detection Line.

The hydraulic pressure that is accumulated in the Wet pilot detection line, maintains the FDV deluge valve [DL] closed.

FIRE situation

When the Wet pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, it enables the FDV control chamber to drain and de-pressurize, opening of the deluge valve and admitting water into the spray sprinkler system. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

RESET position

System reset requires a replacement replacement of all shattered-open wet pilot detection line's automatic fire sprinklers. The wet pilot line is then pressurized by the upstream pressure. The PSA [PS] push button should be pressed to enable upstream pressure passage to close the FDV's main valve.

Deluge systems

Hydraulic Actuated with Remote Reset Deluge Valve

FDV - DH1

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DH1 Deluge system is actuated hydraulically and resets remotely.

When the Wet pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, it enables the FDV control chamber to drain and de-pressurize, opening of the deluge valve and admitting water into the spray sprinkler system. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DH1 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

TECHNICAL DATA

FI IIID-

Water, Brackish water, Sea water, Foam

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flow rates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The trip is actuated by a Wet Pilot Line's hydraulic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges

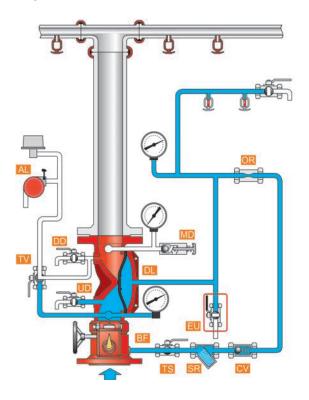

The FDV-DH1 resets to stand-by close position by pressurizing the Wet Pilot

- SR "Y" strainer
- CV Check valve
- **OR** Orifice
- MD MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit
- PC PA-PTC Pneumatic Actuator-Pressure to Close

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by check valve (CV), the closed PA-PTC actuator (PC) and by the closed emergency valve (EU), maintaining the FDV deluge valve (DL) closed.

FIRE situation

When some of the Dry pilot detection line's automatic fire sprinklers are subjected to flames heat and shatter-open, the pilot detection line depressurizes and the PA-PTC control chamber. The PA-PTC (PC) opens and drains the deluge valve's control chamber. The FDV deluge valve opens and admits water to the spray sprinklers line.

RESET position

System reset requires the replacement of all of the dry pilot detection Line's shattered-open automatic fire sprinklers. The detection line is then pressurized, the PA-PTC actuator, to reset it to closed position. The FDV valve control chamber pressurizes as well and the valve closes.

Deluge systems

Hydraulic actuated & Anti-Columning Local Reset Deluge Valve

FDV - DA0

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-DA0 Deluge system is actuated hydraulically and resets locally.

When a hydraulic detection system, a Wet Pilot Detection Line, is exposed to predetermined temperature level, automatic fire sprinklers shatter open causing a pressure drop that activate a pilot valve commanding the FDV-DA0 Deluge valve to open.

The Anti Columning feature ensures system operation, regardlessof the Detection line's height and distance from the Control valve. The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-DA0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

- **OR** Orifice
- **PS** PSA Pressure Supply Arrestor
- **MD** MADV Manual Automatic Drain Valve
 - ..
- **TV** Alarm test valve **EU** Emergency Manual Unit
- **DC** DCPV = Drain Control Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the closed PSA (PA), by the closed emergency valve (EU) and by the closed DCPV drain pilot valve (DC). The hydraulic pressure that is accumulated in the Wet pilot line keeps this device in its close position, maintaining the FDV deluge valve (DL) closed.

FIRE situation

When some of the Wet pilot detection line's automatic fire sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot line pressure drops and the DCPV opens it drain port regardless of the residual column pressure.

Opening its drain port, the DCPV releases the FDV control chamber pressure causing it to open and admit water into the spray sprinklers pipeline.

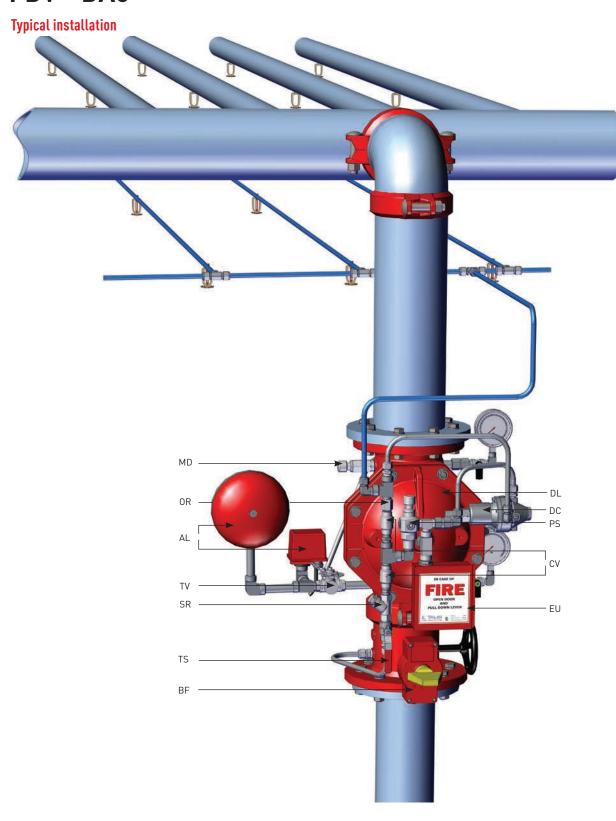

RESET position

System reset requires the replacement of all Shattered-open Fire sprinklers in the Detection pilot line. The wet pilot line is then pressurized to reset the DCPV to closed position. The PSA (PS) push button should be pressed to enable upstream pressure passage close the FDV's main valve.

Modulating Deluge systems

Electrical Actuated with Local Reset, Pressure Reducing Deluge Valve

FDV - PEO

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PE0 is a pressure control Deluge system, actuated electrically and resets locally.

An electric detection systems activates a solenoid valve through a control panel, to open the FDV deluge valve. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure.

The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PE0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

APPROVALS

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position.
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm.
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by an electric signal transmitted to the valve's solenoid from the main control panel, due to a flame heat exposure of a sensors detection system
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges
- A pressure reducing pilot enables a full control over the downstream pressure and ensures a steady set in a wide pressure range

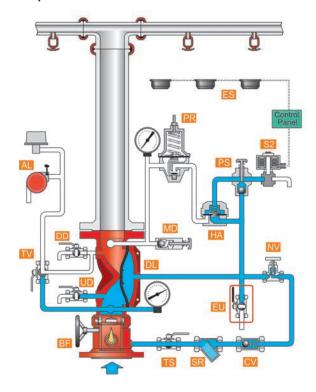

The FDV-PEO resets to stand-by close position by de-energizing the alarm system solenoid's coil through the main control panel and by manually operating the local reset device – the PSA.

Pressurized water in the valve's control chamber (DL) is trapped by check valve (CV), the Closed Drain actuator HAV-2 (HA) and by the closed emergency valve (EU), maintaining the FDV deluge valve (DL) closed.

FIRE situation

When the electric detection system senses heat, it triggers the main control panel that in turn, transmits an electric signal commanding the 2 way solenoid valve (S2) to open. The solenoid drains the HAV-2's control chamber, commanding the Deluge valve to openthrough the pressure reducing pilot (PR), admitting water to the spray sprinklers line at a steady, preset pressure.

RESET position

System reset requires the reset of the electrical alarm system to de-energize and close the solenoid valve. The PSA (PS) push button should be pressed to pressurize the HAV-2's control chamber. When the drain actuator is close, upstream pressurizes the FDV's control chamber and the valve closes.

Modulating Deluge systems

Electric Actuated with Remote Reset, Pressure Reducing Deluge Valve

FDV - PE1

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PE1 is a pressure control Deluge system, actuated electrically and resets remotely.

An electric detection systems activates a solenoid valve through the control panel, to open the FDV deluge valve. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure.

The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PE1 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

SI7F RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, ${\it Thread*Thread}$

PRESSURE NOMINAL:

250 psi (17.2 bar)

REGULATION RATIO: 5:1

SENSITIVITY: 1.45 psi (0.1 Bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by an electric signal transmitted to the valve's solenoid from the main control valve panel, due to a flame heat exposure of heat detection sensors system
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source prevents surges.
- A pressure reducing pilot enables a full control over the downstream pressure and ensures a steady set in a wide pressure range

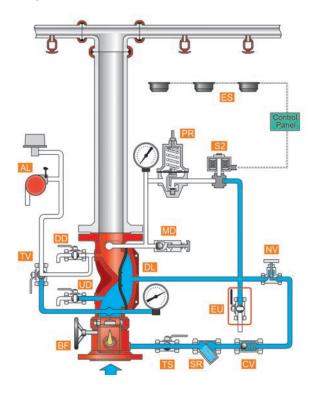

The FDV-PE1 resets to stand-by close position by de-energizing the alarm system solenoid's coil through the main control panel.

- MD MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit
- PR PRPV Pressure Reducing Pilot Valve
- S3 Solenoid 2 way
- ES Electric Sensors system

OPERATION

SET position

Pressurized water in the alve's control chamber [DL] is trapped by the check valve [CV], by the closed 2 way solenoid [S2] and by the closed emergency valve [EU], maintaining the FDV deluge valve [DL] closed.

FIRE situation

When an electric detection system senses flame heat, it triggers the main control panel that in turn, transmits an electric signal, commanding the 2 way solenoid valve [S2] to open. The deluge valve's control chamber drains through the pressure reducing pilot [PR]. The FDV Deluge valve opens, admitting water to the spray sprinklers line at a steady, preset pressure.

RESET position

System reset requires the reset of the electric alarm system to de-energize and close the 2 way solenoid valve. The FDV deluge control chamber pressurizes and the valve closes.

Modulating Deluge systems

Pneumatic Actuated with Local Reset, Pressure Reducing Deluge Valve

FDV - PP0

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PP0 is a pressure control Deluge system, actuated pneumatically and resets locally.

When the pneumatic dry pilot fire detection line is exposed to flame heat, its automatic fire sprinklers shatter-open, venting the air pressure from the FDV-PPO's actuator, commanding the deluge valve to open. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure.

The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PP0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

- **P0** PA-PTO Pneumatic Actuator-Pressure To Open
- **PR** PRPV Pressure Reducing Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by check valve (CV), the closed PA-PTC drain actuator (PC) and by the closed emergency valve (EU), maintaining the deluge valve in its closed position.

FIRE situation

When some of the Dry pilot detection line's automatic fire sprinklers are subjected to flames heat and shatter-open, the pilot detection line depressurizes and the PA-PTC (PC) opens and drains the deluge valve's control chamber through the pressure reducing pilot (PR). The FDV deluge valve opens and admits water at set pressure to the spray sprinklers line.

RESET position

Initiating a system reset requires the replacement of all the dry pilot detection Line's shattered-open automatic fire sprinklers. The PSA (PS) push button should be pressed, to enable air supply intake to pressurize the Dry Pilot Line. By that, the PA-PTC actuator closes and upstream pressurizes the FDV deluge valve's control chamber through the needle valve (NV). Consequently, The Deluge valve closes and water spray stops.

- **PR** PRPV Pressure Reducing Pilot ValVe

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by check valve (CV), the closed PA-PTC drain actuator (PC) and by the closed emergency valve (EU), maintaining the deluge valve in its closed position.

FIRE situation

When some of the Dry pilot detection line's automatic fire sprinklers are subjected to flames heat and shatter-open, the pilot detection line depressurizes. Consequently, the PA-PTC (PC)opens and drains the deluge valve's control chamber through the pressure reducing pilot (PR). The FDV Deluge valve opens, admitting water to the spray sprinklers line at a steady preset pressure.

RESET position

Initiating a system reset requires the replacement of all the dry pilot detection Line's shattered-open automatic fire sprinklers. Then, the Dry Pilot Line need to be pressurized to the desired set pressure. The PA-PTC actuator pressurizes, commanding the FDV deluge valve to close.

Modulating Deluge systems

Electro-Pneumatic Actuated with Local reset, Pressure Reducing Deluge Valve

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PC0 is a pressure control Deluge system, actuated electrically or pneumatically and resets locally.

Two fire detection systems, can independently activate an actuator to open the deluge valve: a pneumatic Dry Pilot detection Line and/or an electric solenoid, connected to sensorst hrough a control panel.

Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure. The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PC0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design ensures high flow rates with minimum head loss.

Commercial

P.O.G

TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

PNEUMATICS: Air, Nitrogen

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

REGULATION RATIO: 5:1

SENSITIVITY: 1.45 psi (0.1 Bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by an electric signal conveyed to the valve's solenoid or by Dry Pilot Line's pneumatic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source prevents surges
- A pressure reducing pilot enables a full control over the downstream pressure and ensures a steady set in a wide pressure range

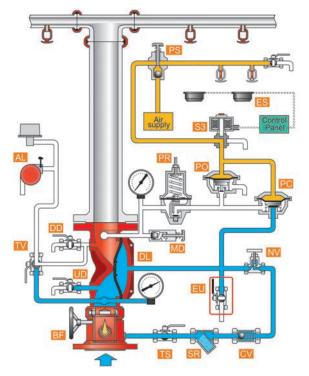

The FDV-PC0 resets to stand-by close position by de-energizing the alarm system solenoid's coil through the main control panel or, pressurizing the Dry Pilot Line and manually operating the PSA device - in accordance with the relevant triggered alarm system.

- **P0** PA-PTO Pneumatic Actuator-Pressure To Open
- **PR** PRPV Pressure Reducing Pilot Valve
- S3 Solenoid 3 way
- ES Electric Sensors system

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by Closed PSA (PA), the closed PA-PTC actuator (PC) and by the closed emergency valve (EU). The pneumatic pressure accumulated in the Dry pilot line is conveyed to the PA-PT Ccontrol chamber through the 3 way solenoid (S3), maintaining the deluge valve in its closed position.

FIRE situation

When some of the Dry pilot detection line's automatic fire sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot line and the PA-PTC control chamber depressurize. Alternatively, an electric detection system senses heat and triggers the main control board that in turn, energizes the 3 way solenoid valve [S3].

The solenoid valve bypasses the dry pilot detection line depressurizing the PA-PTC. The FDV-DCO's control chamber is then drained and the Deluge valve opensthrough the pressure reducing pilot (PR), admitting water to the spray sprinklers line at a steady preset pressure.

RESET position

Initiating a system reset requires the replacement of all shattered-open fire sprinklers in the Wet Pilot detection line. Alternatively, the electrical alarm system has to be reset and the solenoid de-energized. The PSA (PS) push button should be pressed and the Dry Pilot Valve pressurized. Consequently, The PA-PTC pressurizes and closes the FDV deluge valve.

Modulating Deluge systems

Hydraulic Actuated with Local Reset, Pressure Reducing Deluge Valve

FDV - PHO

TALIS FP RANGE

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PH0 is a pressure control Deluge system, actuated hydraulically and resets locally.

When a hydraulic detection system, a Wet Pilot detection Line, is exposed to a predetermined temperature level, its automatic fire sprinklers shatter open, commanding the FDV-PH0 deluge valve to open. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PH0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

- **MD** MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit
- HA HAV-2 Hydraulic Actuator Valve
- **PR** PRPV Pressure Reducing Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the check valve (CV), the closed emergency valve (EU) and by the closed hydraulic drain actuator HAV-2 (HA). The hydraulic pressure accumulated in the Wet Pilot detection line keeps this device in its closed position, maintaining the FDV deluge valve (DL) close.

FIRE situation

When the Wet Pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, the HAV-2 depressurizes and drains the deluge valve's control chamber through the pressure reducing pilot (PR). The FDV deluge valve opens, admitting water to the spray sprinklers line at a steady preset pressure.

RESET position

Initiating a system reset requires the replacement of all shattered-open fire sprinklers in the Wet Pilot detection line. The PSA (PS) push button is then pressed, to enable air supply intake to pressurize the Wet Pilot detection Line. Consequently, the HAV-2 actuator closes, commanding the FDV deluge valve to close.

TALIS FP RANGE

Modulating Deluge systems

Hydraulic Actuated with Remote Reset, Pressure Reducing Deluge Valve

FDV - PH1

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-PH1 is a pressure control Deluge system, actuated hydraulically and resets remotely.

When the Wet Pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, it enables the FDV control chamber to drain and de-pressurize, opening of the deluge valve and admitting water into the spray sprinkler system. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure. The Deluge system incorporates an emergency valve, bypassing the fire detection system for manual operation.

Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PH1 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

MARKET

Airports

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by a Wet Pilot Line's hydraulic pressure release due to its exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source, prevents surges
- A pressure reducing pilot enables a full control over the downstream pressure and ensures a steady set in a wide pressure range

- **HA** HAV-2 Hydraulic Actuator Valve
- **PR** PRPV Pressure Reducing Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the check valve (CV), the closed emergency valve (EU) and by the closed hydraulic drain actuator HAV-2 (HA). The hydraulic pressure accumulated in the Wet Pilot line keeps this device in closed position, maintaining the FDV deluge valve (DL) close.

FIRE situation

When the Wet Pilot detection line's automatic fire sprinklers are subjected to flame heat and shatter-open, the HAV-2 depressurizes, drains the deluge valve's control chamber through the pressure reducing pilot (PR). The FDV deluge valve opens, admitting water to the spray sprinklers line at a steady preset pressure.

RESET position

Initiating a system reset requires the replacement of all Shattered-open fire sprinklers in the Wet Pilot detection line. By that, the HAV-2 actuator closes and upstream pressurizes the FDV Deluge valve's control chamber through the needle valve (NV). Consequently, The Deluge valve closes and water spray stops.

Modulating Deluge systems

Hydraulic actuated, Pressure reducing Local Reset Deluge Valve & Anti-Columning

FDV - PAO

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments. The FDV-PA0 is a pressure control deluge system, actuated hydraulically and resets locally. When a hydraulic detection system, a Wet Pilot Detection Line, is exposed to predetermined temperature level, automatic fire sprinklers shatter open causing a pressure drop that activate a pilot valve commanding the FDV-PA0 Deluge valve to open. Once open, the valve reduces the inlet high pressure to a predetermined fixed outlet pressure. The Anti Columning feature ensures system operation, regardless of the Detection line's height and distance from the Control valve. The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-PA0 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head

APPROVALS

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple manual reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of waterbased Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by a Wet Pilot Line's hydraulic pressure release due to its exposure to flame heat. The Anti-Columning properties guarantees an immediate system trip, regardless of the Wet pilot height
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source prevents surges
- A pressure reducing pilot enables a full control over the downstream pressure and ensures a steady set in a wide pressure range

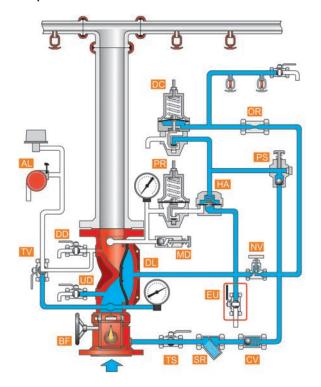

The FDV-PA0 resets to stand-by close position by pressurizing the Dry Pilot Line and manually operating the PSA device.

- MD MADV Manual Automatic Drain Valve
- TV Alarm test valve
- EU Emergency Manual Unit
- HA HAV Hydraulic Actuator Valve
- PR PRPV Pressure Reducing Pilot Valve
- DC DCPV Drain Control Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by a check valve (CV), by the closed emergency valve (EU) and by the closed HAV-2 (HA) actuator. The hydraulic pressure accumulated in the wet pilot line, keeps the DCPV drain pilot (DC) in its close position, maintaining the HAV-2 closed and by that, FDV deluge valve (DL) also closes.

FIRE situation

When some of the wet pilot detection line's automatic sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot Line pressure drops and the DCPV opens its drain port regardless of the residual column pressure. Opening its drain port, the DCPV opens the HAV-2 actuator to drain the FDV's control chamber through the pressure reducing pilot (PR). The FDV deluge valve opens and admits water to the spray sprinklers line at a steady preset pressure

RESET position

Initiating a system reset requires the replacement of all shattered-open fire sprinklers in the detection pilot line. The Wet Pilot Line is then pressurized to reset the DCPV to its close position. The PSA (PS) push button should be pressed to enable upstream pressure passage to the HAV-2's control chamber and to close the FDV valve.

- EU Emergency Manual Unit
- **PR PRPV -** Pressure Reducing Pilot Valve
- DC DCPV Drain Control Pilot Valve

OPERATION

SET position

Pressurized water in the valve's control chamber (DL) is trapped by the check valve (CV), the closed emergency valve (EU) and by the closed DCPV drain pilot actuator (DC). The hydraulic pressure accumulated in the Wet pilot line keeps the DCPV in its close position, maintaining the FDV deluge valve (DL) close.

FIRE situation

When some of the Wet pilot detection line's automatic sprinklers are subjected to the predetermined temperature levels and shutter-open, the pilot line pressure drops and the DCPV opens its drain port regardless of the residual column pressure. Opening its drain port, the DCPV releases the FDV's control chamber pressure through the reducing pilot (PR). The FDV deluge valve opens, admitting water to the spray sprinklers line at a steady, preset pressure.

RESET position

Initiating a system reset requires the replacement of all shattered-open fire sprinklers in the Wet Pilot detection Line. The Wet Pilot Line is then pressurized to reset the DCPV to its close state. Consequently, The Deluge valve closes and water spray stops.

Basic Deluge systems

Electric Actuated with Remote Reset Deluge Valve

FDV - AE1

The FDV-AE1 is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-AE1 Deluge system actuates electrically and resets remotely.

The sensors connected to the fire detection Panel, activate an electric signal transmitted to a solenoid valve and commands the valve to open.

The Deluge system incorporates an emergency valve, bypassing the fire detection panel for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-AE1 valve features a direct elastomeric diaphragm seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

SR - "Y" strainer

CV - Check valve

OR - Orifice

TV - Alarm test valve

EM - Emergency valve

HA - HAV-2 – Hydraulic Actuator

Valve (2 way)

S3 - Solenoid 3 way

OPERATION

SET position

Pressurized water in the valve's control chamber is trapped by the check-valve (CV), by the closed HAV-2 actuator (HA) and by the closed emergency valve (EM), maintaining the deluge valve in closed position.

The 3 way solenoid pressurizes the HAV-2, holding it in its close position.

FIRE situation

When one or more of the electric heat or flame sensor detects fire, it signals the control panel that in turns, energizes the 3 way solenoid (S3). The solenoid commands the HAV-2 to open and the actuator drains the FDV's control chamber to the atmosphere. The FDV deluge valve opens and water flow into the spray sprinklers pipe line. It manually opening the Emergency valve (EM), drains the FDV control chamber and open the valve immediately.

RESET position

When the control panel de-energizes the solenoid, the upstream supply pressurizes the HAV-2's control chamber, commanding it to close. The upstream pressure flows through the orifice (OR) to the FDV valve's control chamber and the valve closes, returning to Set position.

Basic valve systems

Pneumatic Actuated with Remote Reset Deluge Valve

FDV - AP1

The FDV is a Fire Protection control valve for Deluge fire sprinkler systems, designed for installations in hazardous environments.

The FDV-AP1 Deluge system actuates pneumatically and resets remotely. When a pneumatic pressure accumulated in the Dry Pilot detection line is exposed to a predetermined temperature level, the automatic fire sprinklers shatter-open, venting the air pressure from the detection line. The drop in pressure opens the pneumatic actuator that in turn commands the Deluge valve to open.

The Deluge system incorporates an emergency valve, bypassing the fire detection systems for manual operation. Designed for vertical or horizontal installation, a globe pattern, line pressure operated FDV-AP1 valve features a direct elastomeric diaphragm Seal. It has no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

PNEUMATICS:

Air, Nitrogen

SIZE RANGE:

40mm to 250mm (11/2" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Full bore unobstructed
- Simple reset of the valve to standby position without draining or opening the valve itself, neither closing OS&Y or other valves in the system
- Open fail safe valve, maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line with only one replaceable part which is long life elastomeric diaphragm
- Conforms with inspection, testing and maintenance standard of water-based fire protection systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber. The valve is actuated by the Dry Pilot Line's pneumatic pressure release due to its automatic sprinklers exposure to flame heat
- Soft closing upon pressurization of the valve's control chamber, by line pressure or other independent water source to prevents surges

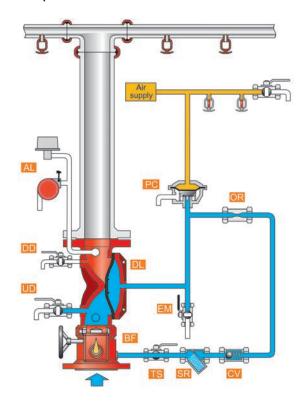

The FDV-AP1 resets to stand-by close position by re-pressurizing the Dry Pilot Line.

Set position

Fire position

BF - Butterfly valve

DL - FDV Deluge valve

AL - Acoustic & Electric alarms

TS - Trim supply valve

SR - "Y" strainer

CV - Check valve

OR - Orifice

EM - Emergency valve

OPERATION

SET position

Pressurized water in the valve's control chamber is trapped by the check-valve (CV), by the closed HAV-2 actuator (HA) and by the closed emergency valve (EM), maintaining the deluge valve in closed position.

The 3 way solenoid pressurizes the HAV-2, holding it in its close position.

FIRE situation

When one or more of the electric heat or flame sensor detects fire, it signals the control panel that in turn, energizes the 3 way solenoid (S3). The solenoid commands the HAV-2 to open and the actuator drains the FDV's control chamber to the atmosphere. The FDV deluge valve opens and water flow into the spray sprinklers pipe line. Manually opening the Emergency valve (EM), drains the FDV control chamber and opens the valve immediately.

RESET position

When the control panel de-energizes the solenoid, upstream supply pressurizes the HAV-2's control chamber, commanding it to close. The upstream pressure flows the through the orifice (OR) to the FDV valve's control chamber and the valve closes, returning to Set Position.

- AL Acoustic & Electric alarms
- **TS** Trim supply valve
- SR "Y" strainer
- CV Check valve
- **OR** Orifice
- **EM** Emergency valve
- **HA** HAV-2 Hydraulic Actuator Valve (2 way)

OPERATION

SET position

Pressurized water in the valve's control chamber is trapped by the check-valve (CV), by the closed HAV-2 actuator (HA) and by the closed emergency valve (EM). The hydraulic pressure in the Wet pilot detection line, keeps the HAV-2 actuator in closed position maintaining the FDV deluge close.

FIRE situation

When some of the Wet Pilot detection line automatic fire sprinklers are subjected to the predetermined temperature levels, and shutter open, the pilot detection line depressurizes, opening the HAV-2 actuator. The HAV-2 opens and drains the deluge valve's control chamber. The FDV Deluge valve opens and admits water to the spray sprinklers line.

RESET position

System reset requires the replacement of all shattered-open Fire sprinklers in the Wet Pilot detection line. The Wet Pilot detection line is then pressurized to reset the HAV-2 actuator commanding the FDV deluge valve to close.

Monitor Valves

Local Hydraulic Actuated Monitor Valve

FDV-R- MH0

The FDV-R-MH0 is a manually operated On-Off Fire Protection Monitor valve, designed to control the opening and closing of fire Monitors, in special hazard fire protection systems.

Assembled in horizontal or vertical position, the FDV-R-MH0 Monitor valve is locally commanded to open/close by a manual emergency valve.

Operating this valve, commands the main valve by pressurizing or de-pressurizing its control chamber, enabling aquick and effortless operation

The globe pattern, line pressure operated FDV-R-MH0 valve, features a direct elastomeric diaphragm seal, with no balancing spring or internal metallic wet components in the valve body.

The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

This valve can be supplied upon request in a PRV configuration, were the monitor's pressure is reduced, to satisfy the system's design.

TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

SIZE RANGE:

50mm to 200mm (2" to 8")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- 3 way control principle ensure fast and reliable opening
- Open fail safe valve in high ambient temperatures
- Maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part - the long-life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head
- The valve trips open by manually opening a 3 way ball valve and draining the valve's control chamber
- Closing the manual ball valve stops the control chamber's drainage and pressurizes it. By that, the monitor valve closes
- Soft closing controlled pressurization of the valve's control chamber, prevents surges

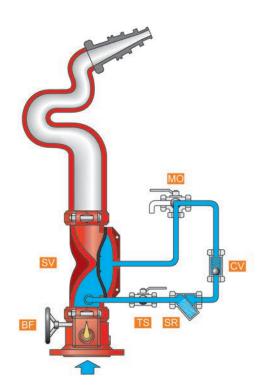

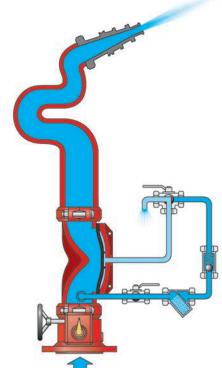

Schematic drawing

Set position

SV - FDV-R Valve

TS - Trim supply valve

SR - "Y" strainer

CV - Check valve

MO - Manual Operation valve (3 way)

BF - Butterfly valve

OPERATION

SET position

Pressurized water in the valve's control chamber (SV) is trapped by the Check Valve (CV), forces the valve's diaphragm against its seat and maintains the FDV-R valve close.

FIRE situation

Opening the Manual Operation valve (MO), drains the FDV-R's control chamber and opens the valve.

RESET position

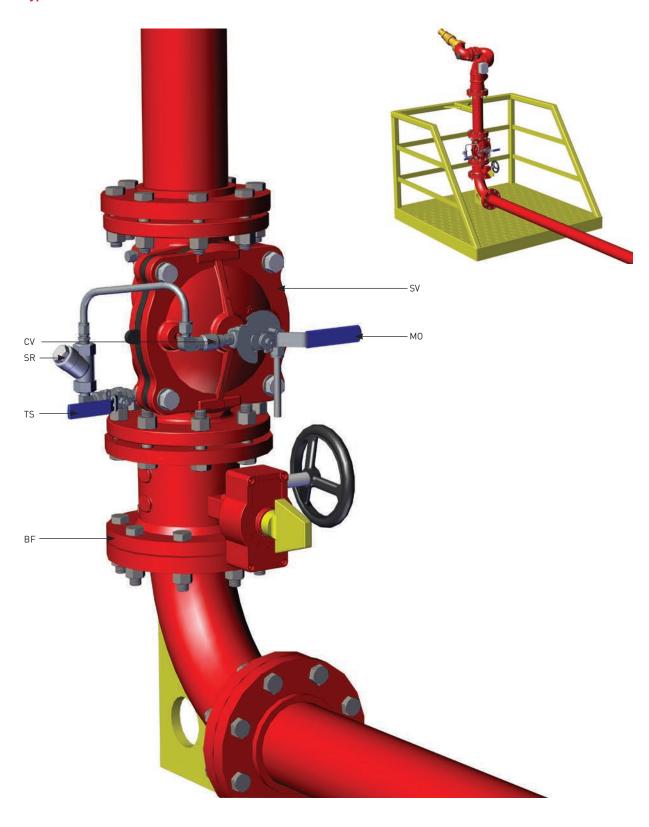

Closing the Manual Operation valve, stops the FDV-R's control chamber drainage admits upstream pressure and pressurizes it. Consequently, the valve's diaphragm is forced to its seat and the valve closes.

Monitor Valves

Remote Hydraulic Actuated Monitor Valve

FDV-R-MH1

The FDV-R-MH1 is a hydraulic controlled On-Off Fire Protection Monitor valve, designed to control the opening and closing of fire Monitors, in special hazard fire protection systems.

Assembled in horizontal or vertical position, the FDV-R-MH1 Monitor valve is commanded to open/close from a control panel or control room, by a hydraulic actuator. The actuator in turns, commands the valve bypressurizing or de-pressurizing the main valve's control chamber, enabling a quick and effortless operation.

The FDV-R-MH1 incorporates an emergency valve, bypassing all terms for a manual operation.

The globe pattern, line pressure operated FDV-R-MH1 valve features a direct elastomeric diaphragm seal, with no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

Industry

TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

SIZE RANGE:

50mm to 200mm (2" to 8")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- 3 way control principle ensure fast and reliable opening
- Open fail safe valve in high ambient temperatures
- Maintained in stand-by closed position
- Low maintenance cost: the valve is serviced in-line and only one replaceable part the long-life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head loss
- The valve trips open automatically upon a gradual release of water pressure from its control chamber
- The trip is actuated by a hydraulic command pressure transferred by a pilot pipeline, operating a 3 way actuator
- Soft closing by controlled pressurization of the valve's control chamber, prevents surges

BF - Butterfly valve

OPERATION

SET position

Pressurized water in the valve's control chamber (SV) is trapped by the Check Valve (CV), forces the valve's diaphragm against its seat and maintains the FDV-R valve close.

FIRE situation

A remote hydraulic command transferred by a pilot pipeline, pressurizes the Hydraulic Actuator valve's control Chamber (HA).

Consequently, the actuator change state and drains the FDV-R's Control Chamber. The valve opens and admits water to the monitor pipeline.

Opening the Manual Operation valve (MO), bypasses all term, drains the FDV-R's control chamber and opens the valve.

RESET position

As the pilot pipeline command pressure drops, the Hydraulic Actuator stops the FDV-R's control chamber drainage, admits upstream pressure and pressurizes it. Consequently, the valve's diaphragm is forces against its seat and the valve closes.

Hydraulic Hydrants

Hydraulic Actuated, Pressure Reducing Hydrant Valve

FDV-Ra- HHP

The FDV-R-HHP is a hydraulic controlled On-Off Fire Hydrant, designed to connect a pressurized fixed water supply network to a mobile extinguishing unit, through a fire brigade's quick coupling adapter.

Mounted on a breakage device or directly onto a standpipe, the FDR-R-HHP Hydraulic Hydrant is locally commanded to open/close by a manual emergency valve.

The manual emergency valve commands by pressurizing or de-pressurizing the Hydraulic Hydrant's control chamber, enabling a quick and effortless operation of the Hydraulic Hydrant.

Once commanded to open, the FDR-R-HHP valve acts as a pressure reducing valve, reducing the inlet water pressure to a pre-set desired outlet pressure. The outlet pressure is maintained constant regardless of fluctuations in flow rate and changes in main pipeline pressure.

Designed for vertical installation, the Angle pattern, line pressure operated FDV-R-HH0 Hydraulic Hydrant features a direct elastomeric diaphragm seal with no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design ensures high flow rates with minimum head loss.

OPTIMUM

CORROSION PROTECTION

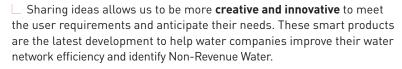

TALIS' ANSWERS

☐ TALIS group has established in France a hydrant center of compe-

which centralizes all new development and oversees three R&D engineering offices in Europe.

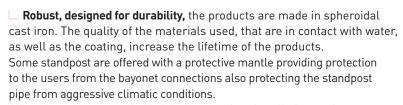

This organization allows us to share our expertise and pool our technical know-how in order to continually improve our range.

A broad range of products in both underground and standpost design, offers suitable solutions for all areas of application.

We provide to our customers with a high degree of flexibility to fulfill their many requirements. The products are provided with the outlet types required by the country's standards, a breakable system to avoid leakage in case of impact and a quick repair kit to reduce the cost of maintenance.

All products have an optimized design to reduce installation, maintenance and operational costs for customers.

Various coating for high level of corrosion protection,

depending the country's requirements, TALIS group is able to supply three different coating types

- Epoxy by cataphoresis: Combining the advantages of both processes (cataphoresis + Epoxy) to ensure effective corrosion protection by limiting the overall coating thickness that can cause a lower impact
- Enamelled: Enamel is a vitreous, high-strength material, wherein short fibres in the material form a durable and permanent bond with the metallic substrate material, which prevents the enamel from cracking in
- DUPLEX corrosion protection: An innovative corrosion protection system made up of two components: zinc as a basic coat and a topcoat, on an EP/ PUR basis, as the second coat.

BAYARD HYDRANT

SINCE THE BEGINNING OF THE 20TH CENTURY, **BAYARD HAS ACQUIRED** A HUGE KNOW HOW IN THE FIRE PROTECTION SEGMENT AND HAS DEVELOPED A WIDE RANGE OF FIRE HYDRANTS. THEIR INNOVATIONS AND THE QUALITY OF THEIR PRODUCTS HAVE PROPELLED THEM TO NATIONWIDE PROMINANCE. FOR MORE THAN 50 YEARS BAYARD HAS STOOD UP AS A LEADER IN THE FRENCH MARKET WITH A 65% MARKET SHARE AND MORE THAN 700 000 STANDPOSTS AND UNDERGROUNDS INSTALLED IN FRANCE.

A LEADING RANGE OF HYDRANTS

complying with the highest customer requirements in respect of French regulations

SAPHIR RANGE

WHICH TYPE OF CONNECTION IS IT?

Everywhere in France, all fire hydrants have an identification colour which is helpful for fireman to save precious time on site in order to choose the right type of hose to connect to them.

Two levels of information are given by the product:

- Type of water network indicated by colour of product body (SAPHIR range) or protective mantle (EMERAUDE range).
- □ Diameter / flow rate of network indicated by the colour of sticker on protective mantle (EMERAUDE range) or size of product (SAPHIR range).

	RED	BLUE	YELLOW
TYPE OF NETWORK	Under pressure	Suction application	Surpressed network
EMERAUDE	DN80 DN100 DN150		
SAPHIR			

EMERAUDE installed on the city water network

Vintage design for old down town installation

Suction fire hydrant installed when water network is not available

SAPHIR DN150

SAPHIR DN100

EMERAUDE DN100

BAYARD RETHINKS THE FIRE PROTECTION

8 optimized standpost offers with protective mantle or apparent outlets

• TAGUA & COPERNIC FACTORY FITTED

OPTION, **POSSIBLE TO INSTALL COPERNIC ON**

CONNECT ALL YOUR STANDPOSTS ALREADY INSTALLED

INTEGRATE THE ASSET **MANAGEMENT** TAGUATM MONITORING FIRE HYDRANT WITH COPERNIC™ SOLUTION

BAYARD RANGES HAVE BEEN DEVELOPED TO SAVE MAINTENANCE COST, TO SAFE ITS USAGE BY FIREMEN AND TO PROTECT THE WATER NETWORK.

EASY FOR THE MAINTENANCE

Among multiple benefits offered by the BAYARD range, one of the most important is the backward compatibility of spare parts. Since 1973 the ranges has been improved in order to retain internal backward compatibility of spare parts for all models, reducing the need for customers to keep spare parts in stock.

The annual maintenance of the valves can be done from above, thus avoiding the need to dig. The spindle can be removed easily for the top of the hydrant.

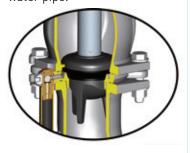

THE SECURITY FOR USERS

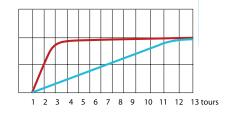

The air clap's function is to decompress the pillar hydrant. In case of wrong handling, the stand post may come under pressure from the residual water inside. Handling the stand post to open an outlet can therefore be dangerous. By pressing the clap air, the air will be dispelled, permitting the outlet to be opened safely. The water will remain in the pillar without being ejected.

THE PROTECTION OF WATER NETWORK

In case of quick opening and closing fire hydrant, the special design of the shut off valve prevents water hammer, while its shape drastically reduces the vibrations which could damage the water pipe.

Progressive closing, blue curve

EASY TO INSTALL

Whatever the ground configuration for a primary installation or after works on streets, standposts and undergrounds may be raised and adapted to all heights with adjustable pipes.

The product can be handled easily without causing damage thanks to the **polyester packaging**.

Full range from DN65 to DN150 adapted for **freezing and hot climatic** conditions.

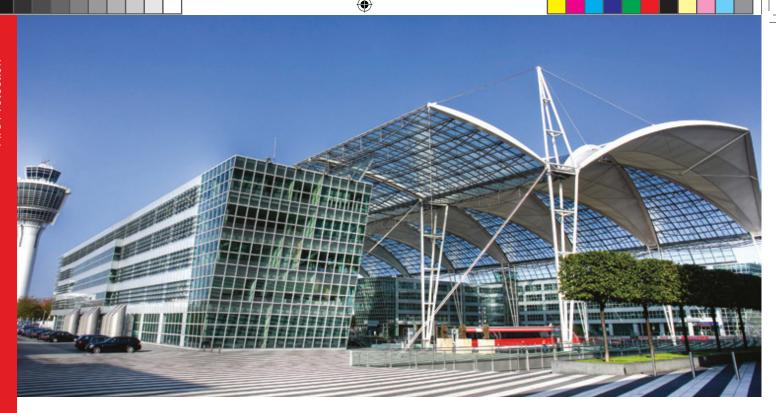

ERHARD HYDRANT

ERHARD HYDRANTS ARE AVAILABLE IN TWO BASIC DESIGNS WHICH OFFER SPECIAL ADVANTAGES DEPENDING ON THE AREA OF APPLICATION:

- **THE UNDERGROUND HYDRANT** IS NOT A TRAFFIC OBSTACLE AND. THANKS TO ITS POSITION, SAFE FROM DAMAGE.
- □ IN CONTRAST, THE **POST HYDRANT** IS ALWAYS EASILY VISIBLE, EVEN IN THE DARK OR SNOW. ANOTHER ADVANTAGE IS THAT NO ADDITIONAL STANDPIPE IS NEEDED TO WITHDRAW WATER. WHICH MEANS WATER IS AVAILABLE IMMEDIATELY.

With its broad range of products in both product areas, ERHARD offers suitable solutions for every area of application and has thus been a tried-and-trusted partner to utilities companies and fire brigades all over the world for many years. The range is supplemented by suitable accessories such as extensions, protective covers, bayonet connections and much more besides.

In contrast to valves in systems, hydrants are installed in the public space and have to be able to be operated easily and safely by fire officers in the event of a fire.

Post hydrants are also exposed permanently to the weather, which must not have any limiting effect on function. For this reason, the most stringent requirements are applicable for hydrants in terms of operational safety and durability.

PROPERTIES AND ADVANTAGES AT A GLANCE

Maximum tightness long-term

Double cut-off with ball on enamelled seat and PUR shut-off cone

2 Inner fittings are not ejected during maintenance or dismantling work

Safety interlock, stop and anti-rotation grip for the inner fittings

Ourability and operational safety even after many years

Top material quality and perfect corrosion protection e.g. through sleeve pipes enamelled on the inside, blind threaded holes, galvanised square caps or bonnets made of cast aluminium

4 Hygiene and frost protection

Safe water draining through draining valve and draining pipe with dry section

6 Ease of service and repairs

Defined break system on the post hydrants, continuously adjustable rotation

10 Low actuating torques during opening Integrated thrust washers

Safe vibration-free operation

Bayonet with special lug for anchoring the standpipe hydrant head inside and out- side blue enamelled, outside additionally red enamelled Inside: smooth surface, hygienic, against deposits. Outside: resis

ERHARD hydrants have numerous well-thought-out design features guarantee users reliable operation and maximum safety.

CUT-OFF PROVIDES MAXIMUM SAFETY THANKS TO PUR CONE AND MULTI-CHAMBER BALL

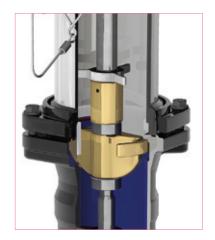

The shut-off cone in ERHARD hydrants is connected to the valve insert pipe by a secure compression connection and thus reliably seals the enamelled seat of the bottom part of the post.

DOUBLE CUT-OFF

The safety system is supplemented by an additional cut-off with a multichamber ball or a steel plate ball in the case of underground hydrants. This closes the seal on the inlet fitting solely through water pressure and thus quarantees double safety.

SOPHISTICATED SAFETY INTERLOCK

ERHARD post hydrants are equipped with a safety interlock directly under the break system. This reliably prevents ejection of the inner set of fittings, should the working pressure be unforeseeably applied at the shut-off cone when the hydrant is dismantled.

SERVICE-FRIENDLY BREAK SYSTEM AND ROTATION OF THE UPPER PART OF THE POST

The break system can easily be repaired in the event of damage (e.g. if the hydrant is damaged in an accident). The break ring safely protects all the internal drive parts from damage. The design also allows the upper part of the post to be turned continuously through 360° after the connection bolts have been loosened.

RELIABLE DRAINING

After the hydrant has been used, a draining valve on the hydrant head together with a draining pipe on the main shut-off valve, which has a sufficient dry section, ensures reliable discharge of the residual water. This guarantees reliable hygiene and safe frost protection.

TOP MATERIAL QUALITY AND OPTIMUM CORROSION PROTECTION

- □ All the casing parts made of ductile cast iron are protected on the inside by ERHARD Pro-Enamel enamelling. Alternatively, stainless steel may be used for the upper parts of the posts.
- ☐ The drive parts are also made of stainless materials, making them predestined for decades of use in the ground
- ☐ The outer casing parts underground are coated with an enamel primer and double coating of synthetic resin.
- Special protection is required for the outer casing parts above ground, where the DUPLEX system comprising zinc spraying and a double EP / PUR-based top coating or full enamelling with ERHARD Pro-Enamel is used.

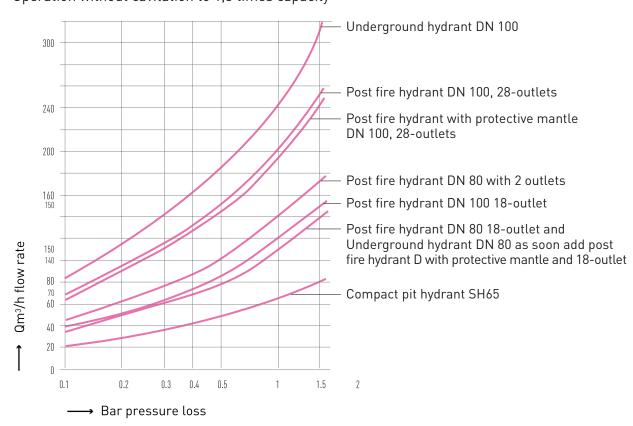

ERHARD UNDERGROUND HYDRANT

- The innovative shut-off cone makes the ERHARD underground hydrant DN80 with PUR cone particularly durable, since the PUR sheathing of the shut-off cone results in very high abrasion resistance and thus low wear. At the same time it is insensitive to dirt and has a very good tear propagation resistance and a high ageing resistance. It goes without saying that the ERHARD underground hydrant with PUR cone is also fitted with a safety interlock for the inner set of fittings which prevents their dangerous ejection during dismantling.
- During improper dismantling e.g. in an attempt to remove the inner set of fittings under operational pressure, the pressurised inner set of fittings is not ejected outwards but rather trapped by a safety stop. The underground hydrant is made completely in ERHARD Pro-Enamel for optimum corrosion protection.
- oxdot The ERHARD underground hydrant with flange connection is available with different claw-covers:
 - Claw-cover made of plastic
 - Self-locking claw-cover made of EN-JS1050
 - Claw-cover which remains open, made of EN-JS1050

An optimized design for all ERHARD ranges in order to minimize the pressure losses

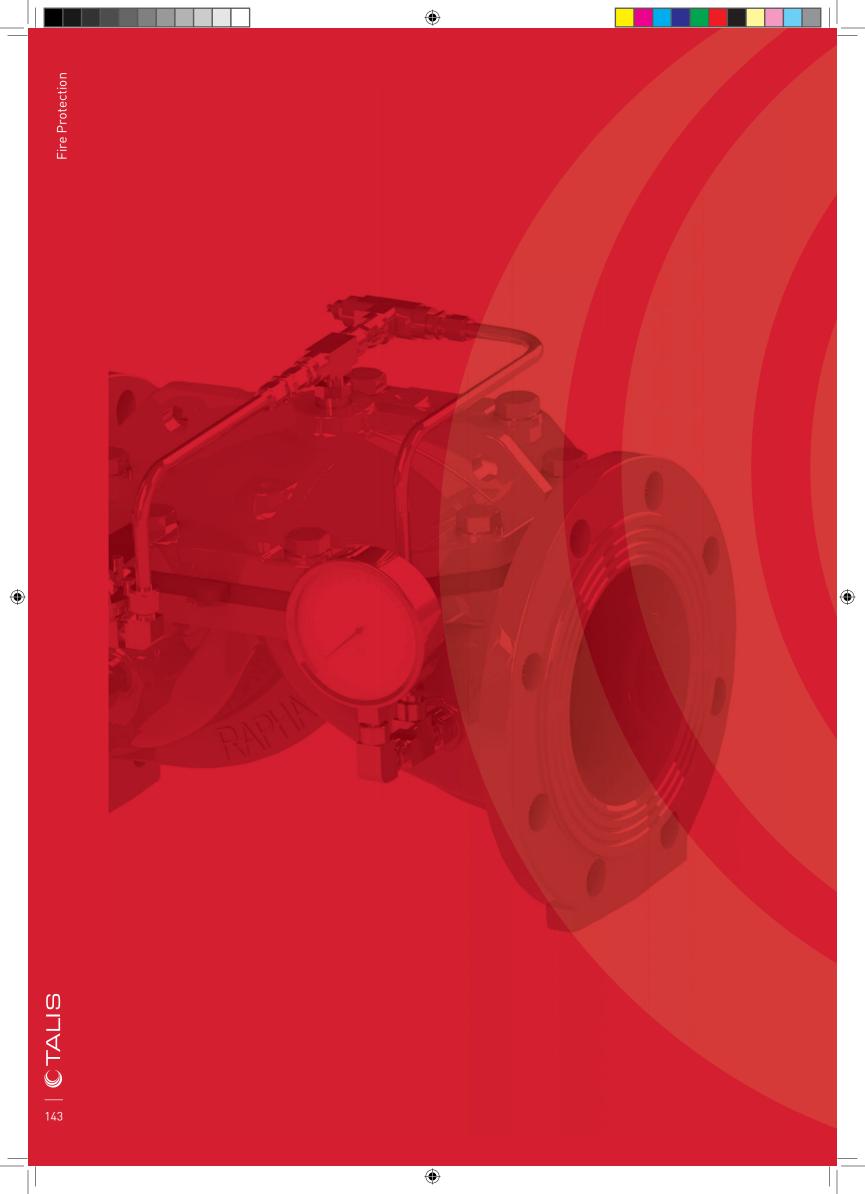

Operation without cavitation to 1,3 times capacity

SERVICE VALVES

CONTROL VALVES

FDV-R-PN2 - 145

FDV-R-RN2 - 149

Control Valves

Pressure Reducing Control Valve

FDV-R-PN2

The FDV-R-PN2 Pressure reducing valve is an automatic hydraulic control service valve, designed to operate in fixed fire protection system.

The FDV-R-PN2 pilot controlled hydraulic valveis activated by line pressure. The pilot valve has a spring-loaded membrane which is sensitive to downstream pressure. The pilot's spring is pre-set to a desired reduced pressure. The pilot valve maintains a constant downstream pressure by gradually opening or closing of the main valve, reducing the inlet water pressure to a pre-set desired outlet pressure. The outlet pressure is maintained constant, regardless of fluctuations in flow rate and changes in main pipeline pressure.

Designed for vertical or horizontal installation, the line pressure operated FDV-R-PN2 Pressure reducing valve features a direct elastomeric diaphragm seal, with no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

Industry

Residential

FLUID:

Water, Brackish water, Sea water, Foam

ECHNICAL DATA

FDV-R valve (globe) - 40mm to 400mm (1½" to 16") FDV-Ra valve (angled) - 50mm to 200mm (2" to 8")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

REGULATION RATIO: 5:1

SENSITIVITY: 1.45 psi (0.1 Bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Low maintenance cost: the valve is serviced in-line and only one replaceable part - the long-life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25
- Reduces inlet pressure to a predetermined fixed and constant outlet pressure, regardless of fluctuations or changes in main pipeline pressure and flow

CHARACTERISTICS

- Hydro-dynamic pattern design ensures high flowrates with minimum head
- Simple and reliable design
- Quick respond to downstream pressure changes
- Pressure reducing to a predetermined set of outlet pressure

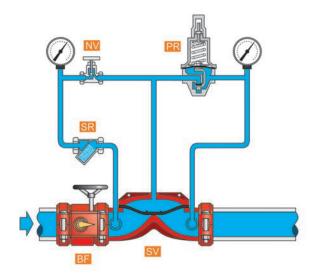

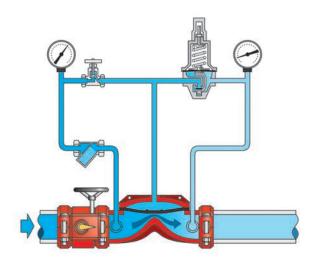

Schematic drawing

Set position

Fire position

PR - PRPV - Pressure Reducing Pilot Valve

NV - Needle valve

SR - strainer

SV - FDV-R service valve

BF - Butterfly valve

SET Position:

When a fire protection system is in a SET position, there is no flow at the system's piping and the water pressure is at the FDV-R-PN2 Pilot's SET pressure.

The FDV-R-PN2 valve's control chamber is pressurized by the inlet flow, calibrated by the Needle valve [NV] forcing the diaphragm against its seat maintaining the valve close.

OPERATION

The FDV-R's control chamber is pressurized by a calibrated inlet flow passing through a needle valve [NV], and de-pressurized by the PRPV pressure reducing pilot valve [PR].

The pilot's drain flow volume is controlled by the downstream pressure passing through a sense pipe and manipulating the pilot's diaphragm and the seal mechanism.

Any change at the downstream pressure reflects the ratio between the volume of the control chamber's inlet and outlet flows. Consequently, the FDV-R valve's diaphragm position changes, maintaining the downstream at the pilot's set pressure.

TALIS FP RANGE

Control Valves

Pressure Relief Control Valve

FDV-R-RN2

The FDV-R-RN2 Pressure Relief valve is an automatic hydraulic control service valve, designed to operate in fixed fire protection system, especially in fire pump units. The FDV-R-RN2 pilot controlled hydraulic valve is activated by line pressure. The pilot valve has a spring-loaded membrane which is sensitive to upstream pressure. The pilot's spring is pre-set to a desired maximum pressure. The pilot valve maintains a maximum pressure in the pipe system by quickly opening the main valve, discharging any excess pressure off the pipe system, preventing any potential damage.

Designed for vertical or horizontal installation, the line pressure operated FDV-R-RN2 Pressure Relief valve features a direct elastomeric diaphragm seal, with no balancing spring or internal metallic wet components in the valve body. The hydrodynamic pattern design, ensures high flow rates with minimum head loss.

FLUID:

Water, Brackish water, Sea water, Foam

SIZE RANGE:

FDV-R valve (globe) - 40mm to 400mm (11/2" to 16") FDV-Ra valve (angled) - 50mm to 200mm (2" to 8")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

REGULATION RATIO: 5:1 SENSITIVITY: 1.45 psi (0.1 Bar)

ADVANTAGES

- Only three parts: body, diaphragm & cover plate, no wet metal spring inside the control chamber
- Low maintenance cost: the valve is serviced in-line and only one replaceable part - the long-life elastomeric diaphragm
- Conforms with inspection, Testing and Maintenance Standard of water-based Fire Protection Systems, NFPA 25
- · Maintains a constant set upstream pressuresecuring the system from over pressure

CHARACTERISTICS

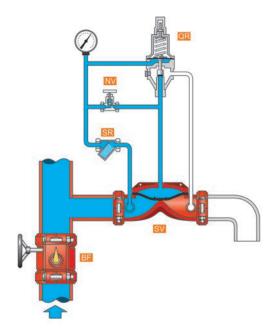

- Hydro-dynamic pattern design ensures high flowrates with minimum head
- Simple and reliable design
- Quick respond to downstream pressure changes

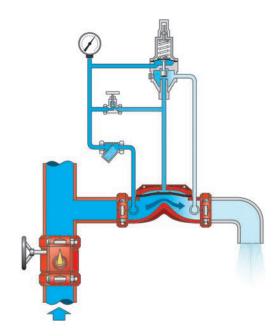

Schematic drawing

Set position

Fire position

QR - QRPV - Quick Relief Pilot Valve

SR - strainer

NV - Needle valve

SV - FDV-R service valve

SET Position:

When a fire protection system is in SET position, and water pressure in the pipe system is maintained within the pre-established pressure range considered safe for operation, the FDV-R-RN2 will remain closed.

The FDV-R-RN2 valve's control chamber is pressurized by the inlet flow, pre calibrated by the Pressure Relief Pilot [QR] forcing the diaphragm against its seat, preventing the valve from opening.

OPERATION

When the Fire system trips open and Fire pump starts-up and pressure rises in the pipe system surpassing the preset maximum pressure, the FDV-R-RN2 will quickly open, to enable water discharge out of the pipe system to the valve's downstream.

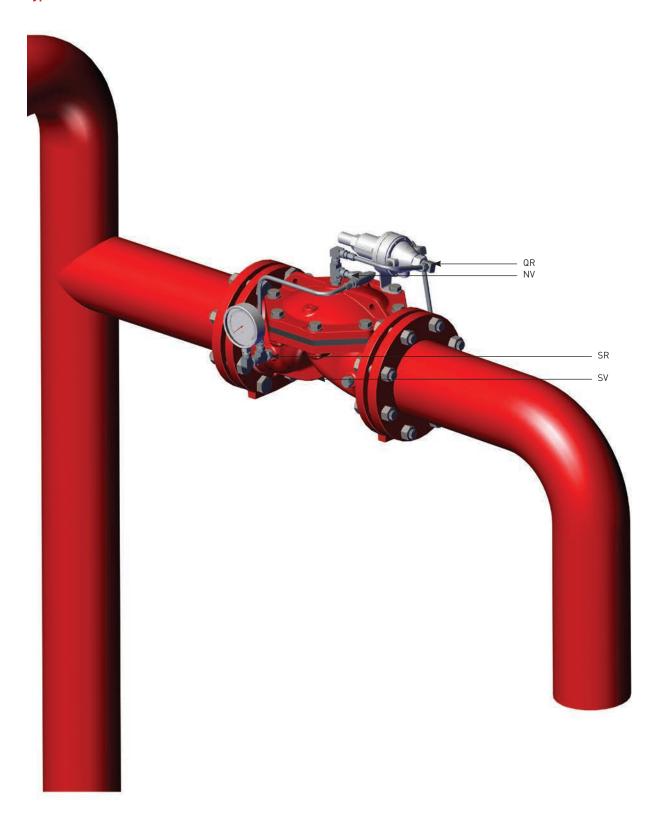

The valve is controlled by the Pressure relief pilot. The pilot's is commanded by a hydraulic sensor port, connected to the pipe system, through the valve's upstream port. The pilot commands the valve to open, proportioning the adequate water passage necessary to maintain the system within the safe maximum required set pressure, regardless of system flow.

TAGUA

TAGUA - 155

Smart Inside

TAGUA Asset Management

TAGUA

TAGUA is a 100% web software associated with a mobil eapplication. It is dedicated to asset management for devices requiring a visit or regular maintenance.

On field, the mobil. application Smart-Inside is available for Android platform The devices managed by TAGUA are equipped with a RFID NFC chip (radio-tag). Reading this TAG allows immediate an unfalsifiable identification. Asset management solution 100% web. TAGUA allows the creation of a database of accumulated Knowledge. It can be interfaced with the master repository (GIS). The software works on a secure web platform. It provide tools to organize maintenance of equipment and create work orders. The users, through a smartphone application, gather and upload data on the cloud. NFC tags are used for the purpose of automatically identifying and tracking attached equipment. They are the key to accessing the database on site and proof that the operator has been on site.

Industry

TECHNICAL DATA

ENVIRONMENT:

All Weather 20°C to + 90°C

SIZE:

40mm in diameter

AVAILABILITY:

Applied on any valve metal surface

Tags 13.56MHz RFID ISO 15693 NFC-enabled

ADVANTAGES

- Any valuable products that need survey / Maintenance during all its life cycle
- TIME SAVING Identification and exact geolocation of units
- SECURE The reading of the tag attests that the technician has been on site Open fail safe valve, maintained in stand-by closed position
- TOP-NOTCH SERVICE Real-time data updating, consultation online
- RELIABLE Unfalsifiable electronic marking device that allows the network managers to guarantee the survey of all valuable equipment in the network (and more) all their life cycle duration
- Associated to our powerful cloud web based secured platform, it provides an unequalled solution to manage the assets
- Every operation can be dealt with TAGUA / www.smart-inside.com: inventory, maintenance operation planning, functional periodical check, etc

CHARACTERISTICS

- RFID microchip with NFC antenna Asset inventory and management with up to date tools: Detailed inventory of park
- Precise location of each unit Planning of work orders Time management of the field teams Online data archiving
- Reading tag RFID with Android application is the key to accessing the data You can consult, change and manage all the location data

Schematic Flow chart

Features

Inventory of detailed and updated park

Precise location of products. Planning of maintenance operations. Load management of field teams. Automatic Export updates to GIS.

Communication tools

Issuance of customized interventions reports Manual or automatic exports. Data transfer by e-mail and/or FTP server.

Software Features

Accessible via the web platform: www.smart-inside.com No installation required on your computer. Connecting using an internet browser type Explorer, Chrome, Firefox, etc... Secure access by login and password. Hyperfile SQL database hosted on Web Server (Cloud).

Feature required for Android App

Platform Android 4.2 or more. Connectivity with 3G / HSDPA / 4G. NFC RFID reader head. GPS. Camera.

Asset inventory and management with up to date tools:

Cloud web based solution for 24/7 data access from almost anywhere with a single. access to the Internet Android application for NFC capable smartphones to work easily on field. Automated exports and reports generation.

Alarms sending via SMS or e-mails in real time.

Life duration - more than several 10th of thousand reading/writing cycles.

Tag material - TPU (Thermoplastic Polyurethane).

Unfalsifiable and secured identification solution:

Tagua NFC tag is stuck on your equipment and can't be removed without destruction Highly resistant to mechanical scratch, waterproof.

Smart-Inside.com web site:

Life cycle data sheet according to standards and regulation.

Secured access by login/password.

Complete overview of your assets.

Access can be granted to technical departments of municipalities, fire departments, etc...

(

TAGUA

Typical Application

Operation

TAGUA combines a detailed equipment listing at a precise geolocation with effective entire life cycle management of the equipment and an unfalsifiable NFC chip.

The manager plans operations at identified locations in its asset. These operations are then allocated to field teams called "Operators". On the field, Smartphone for the operator synchronizes daily, or on demand, with the website www.smart-inside.com. This operation updates the embedded database and sends the result of the last operations carried out by the operator. The equipment is associated with an NFC carried out by the operator. The equipment is associated with an NFC tag; the association between equipment data life cycle sheet and NFC tag is done on field, via the NFC reader of the smartphone

Asset Management

Asset management is a key element for the functioning and operation application. It consists in sheets location for defining precisely the device (brand, pattern, model, year of installation, etc ...) and locate it. The equipment pool is displayed on a map as an icon. Note that asset is common to all Bayard/Talis applications (TAGUA, CO-PERNIC, Moneca...)

Custom report edition

TAGUA can edit, manually or automatically at user freely adjustable frequency, reports in customized format such as PDF, csv and xml.

Notifications sent by email and/or SMS

On a change of operational status, alarms are programmable to notify Status changes of an equipment.

Installation

The installation time of an NFC tag is rapid (less than 5 min). An individual kit Preparation of the bonding surface is provided with each TAGUA. Implementation exploitation NFC TAG are packaged in the form of board with 10 inseparable elements.

Once stuck on the equipment, a pull-out force over 20 kg is necessary to remove the tag (which in fact destroys it

Product code	Number .	Location type	DN	Brand .	Hodel	House number	B/A	Street type	Street name	•

25	25	Fire hydrare pressurised	100	BAHARD	Saphir	12		Rue	de la république	69

Status

This tab is the main screen of TAGUA.

Map display and tabular form of the FUNCTIONAL status of assets

colours used to display the operational status 4

On the map (Fig. 9), the product icon can also be replaced by a round .corresponding to the colour of the operational state.

TAGUA software is an open tool ready to adapt to your habits job. A choice of pre-set operations defined by the standard NFS62-200 is natively available. At all times, the user is able to change or create customized operations according to his needs.

The operations are linked to a notion of time. Thus, a task that would not be carried out in time will change colour to alert its emergency.

Reading the NFC TAG instantly retrieves in the database device location detailed data. There is no more possible identification error Traceability: Reading the NFC TAG is unfalsifiable. Each operation land is registered with the NFC TAG reading information and timestamped when NFC tag is read

Data Backup

Confidential data is automatically backed up on two different servers

via real-time replication system. By single user action, data can be exported at any time in Excel or csv format. Export is also programmable

Identify your assets

The field teams use mobile app for:

- C Inventory.
- C Identification.
- C Geolocation.
- Photographs.
- NFC tag/device

Manage & maintain

Upload data to the server => Data are put online without retype and become available to third party users

Create maintenance routines => The field teams are informed in real-time nature the equipment maintain and related tasks

Communicate

The software communicates for you:

- automatic alerts (SMS / Email)
- Report in PDF format.
- Synchronizing data with GIS.

Facilitate communication

Share data with GIS

Improves the information reliability

Traceability & proof

> Asset management 100% WEB

- Information processing (no information re-keying)
- Better management of field emergencies
- Automatic drafting of intervention reports
- Exchange of information with GIS, etc...
- In case of disaster, tamper-proof traceability of interventions.

Basic Valves

General Description

The FDV hydraulic control valve's solid and simple construction, in edition with its hydro-dynamically engineered inner streamlined flow passages, makes it the valve on which a large selection of fire protection application is based on.

The FDV type is a full bore globe patterned valve featuring direct elastomeric diaphragm seal with no balancing spring or inside metallic moving wet components. The valve is designed for vertical or horizontal installation. Its symmetric shape enables a revers flow without any head loss change.

A selection of cast metals, coatings, diaphragms and fasteners, enables its usage in rough environment and streaming media. The FDV valve is suitable for on-shore as well as off- shore installations and can operate with fresh water, brackish water, foam and seawater.

9 optional ports provide an easy and flexible trim piping and tubing connection.

Tunnels

Industry

Commercial TECHNICAL DATA

FLUID:

Water, Brackish water, Sea water, Foam

SIZE RANGE:

40mm to 250mm (1½" to 10")

AVAILABLE CONNECTIONS ENDS:

Flange*Flange, Groove*Groove, Flange*Groove, Groove*Flange, Thread*Thread

PRESSURE NOMINAL:

250 psi (17.2 bar)

Advantages

- Simple and robust construction
- No inside metallic moving wet components
- 4 side, 2 bottom and 3 cover ports enable easy trim and accessories connection
- Durable material and coatings enables long lasting usage in rough conditions including off shore and seawater
- Large valve sizes and connection ends selection
- Diaphragm original design enables gradual and precise valve opening
- Maintenance free between the NFPA 25 five years checks
- Stands fully in most strict fire protection design and operation demands

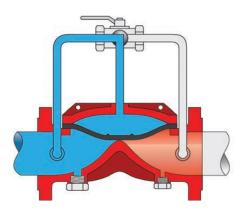

ON-Off Operation

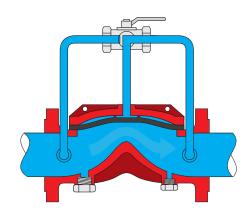

The FDV is a normally open valve with a very low breaking through pressure of less than 5 psi.

When the valve's control chamber becomes pressurized, the force applied on the upper diaphragm surface, pushes it against the valves seat and holds the valve close. The diaphragm's springiness compensates for the low area/force ratio as the valve need to close although the downstream pressure nearly equalizes the upstream.

When the valve's control chamberis drained and de-pressurizes, the force applied by line pressure raises the diaphragm from its seat, pushes it into the control chamber space and drains the residual water out.

By that, water passage obstruction clears and the valves fully opens. This demonstrate a typical On-Off operation: a pressurized control chamber causes the valve to close while a drainage of this space combined with the valve's internal pressure, causes it to fully open.

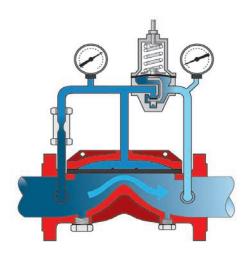

Modulating Operation

Manipulating the control chamber pressure using suitable pilot valves, enables the control of the upstream pressure, downstream pressure and valve's rate of flow.

A change in the control chamber's pressure and as a result, the chamber's water volume, will place the diaphragm at a position that would narrow or enlarge the water passage cross area. Controlled diaphragm moves can be used to regulate gradually valve's flow in regard of line pressure deviation, as demonstrated in the schema bellow.

APPROVALS

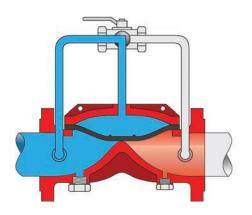

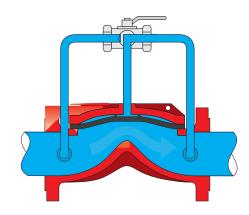

ON-Off Operation

The FDV-R is a normally open valve with a very low breaking through pressure of less than 5 psi. When the valve's control chamber becomes pressurized, the force applied on the upper diaphragm surface, pushes it against the valves seat and holds the valve close. The diaphragm's springiness compensates for the low area/force ratio as the valve need to close although the downstream pressure nearly equalizes the upstream.

When the valve's control chamberis drained and de-pressurizes, the force applied by the line pressure, raises the diaphragm from its seat, pushes it into the control chamber space and drains the residual water out. By that, water passage obstruction clears and the valves fully opens. This demonstrate a typical On-Off operation: a pressurized control chamber causes the valve to close while a drainage of this space combined with the valve's internal pressure, causes it to fully open.

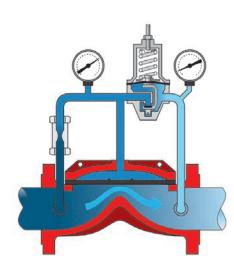

Modulating Operation

Manipulating the control chamber pressure using suitable pilot valves, enables the control of the upstream pressure, downstream pressure and valve's rate of flow.

A change in the control chamber's pressure and as a result, the chamber's water volume, will place the diaphragm at a position that would narrow or enlarge the water passage cross area. Controlled diaphragm moves can be used to regulate gradually valve's flow in regard of line pressure deviation, as demonstrated in the schema bellow.
