

KTM SERIES E01

TRUNNION MOUNTED BALL VALVE

High performance full and reduced bore trunnion mounted ball valves for process applications including refining, petrochemical, chemical, pulp and paper and other process applications

FEATURES

- Design optimized for higher cycle downstream process applications
- Adjustable stem packing gland eliminates need to disassemble valve or operator for fugitive emissions maintenance (specified by API 608)
- Anti-Static device optional
- ISO 5211 topworks for easy actuation
- Double Block and Bleed with self-relieving center cavity and bidirectional seating
- ASME B16.34 compliant design
- PED compliant
- ASME B16.10 long pattern Face to face, ASME B16.5 Flanges
- Fire Tested API 607 / ISO 10497 available with secondary metal seating
- Fugitive Emission ISO 15848-1 Class BH C03 certified stem packing as standard
- Blow out proof stem with position indicator
- Metal backed RPTFE bearing applied in soft seated for lower operating torque
- Tested to API 598 bubble tight seat (zero leakage) using standard RPTFE seat
- Metal Seated leakage FCI 70-2 Class V as standard, tighter shutoff available upon request
- PEEK and Metaltite® metal seated available for abrasive or higher temperature application
- Extended Bonnets available for cold insulation, cryogenic or high temperature applications
- NACE MR0175 / ISO 15156 compliant materials available
- SIL 3 Capable

GENERAL APPLICATION

API 608 / ISO 17292 applications cover industrial process demanding higher temperatures, pressures, and cycle rates or requiring higher performance, materials and engineered solutions, including: refining, chemical, petrochemical, and pulp and paper.

TECHNICAL DATA

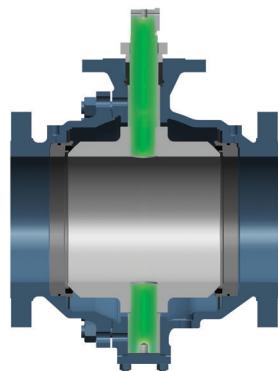

Size range:	Full Bore DN 40 to DN 600 [NPS 1½ to NPS 24] Reduced Bore DN 80 to DN 500 [NPS 3 to NPS 20]
Pressure rating:	ASME Class 150, 300, 600, 900 and 1500
Face to face:	ASME B16.10 Long Pattern
Flange:	ASME B16.5 Raised Face Standard, RTJ Available
Temperature:	-29 °C to 150 °C [-20 °F to 303 °F] Standard, Optional configurations -196 °C to 500 °C [-320 °F to 932 °F]

KTM SERIES E01

KEY FEATURES

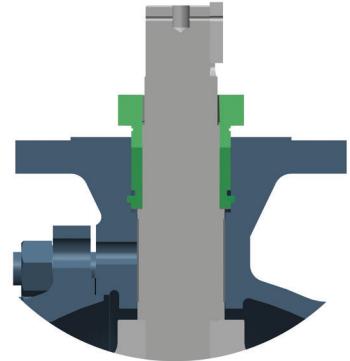

LOWER TORQUE WITH TRUNNION MOUNTED BALL

With conventional floating ball designs, the upstream pressure forces the closed ball to move onto the downstream seat. The resulting torque is a function of pressure induced load force and friction between the ball and seat surfaces. The break to open torque increases proportionately with shutoff pressure differential and/or larger valve seating area. As the size or the differential pressure increases it becomes difficult to operate the valve due to the torque generated by pressure. Trunnion design ball valves alleviate this problem by ensuring that the ball and stem axes are fixed within the valve body, and the seats are energized to the ball. The differential pressure loading is distributed to the trunnion and bearings, resulting in smaller seating surface designs and greatly reduced break to open and operating torque.

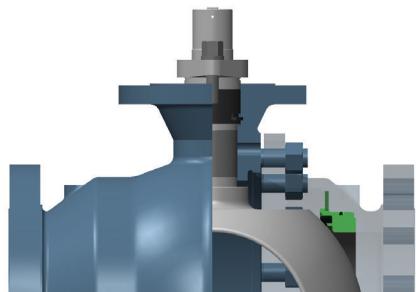

ADJUST PACKING FOR PROCESS APPLICATIONS

Valves used in downstream process applications such as refining, petrochemical, and chemical typically cycle more frequently than pipeline valves used in upstream and midstream oil and gas pipelines. API 608 / ISO 17292 states "adjustable packing glands shall be accessible for re-sealing stem packing without the disassembly of the valve or operator parts," a design feature not required for API 6D pipeline valves where the stem sealing is typically nonadjustable o-ring seals. KTM Series E01 energized gland packing is conveniently accessible, easily adjustable, and can be tightened to compensate for wear or due to temperature fluctuations and process variations. The packing also adheres to Fugitive Emission compliance programs such as LDAR [Leak Detection and Repair], with certified designs to ISO 15848-1 Class BH C03 and API 641.

MAINTAIN CENTER CAVITY PRESSURE WITH SELF RELIEVING SEATS

Should the pressure of the media inside the valve center cavity exceed the line pressure due to thermal expansion of liquids trapped, self relieving seats provide automatic pressure relief without the need of a safety or vent valve. The cavity will relieve through the downstream seat assembly because the ball is held in place by trunnion stems and the downstream seat is under less pressure than the upstream seat, thus cavity relief can occur.

SHUTOFF TIGHTLY WITH ENERGIZED SEATS

The valve achieves shut off when the seat insert presses against the closed, stationary ball due to the line pressure and seat spring acting on the upstream seat retainer. An Inconel X-750 spring provides an initial load to ensure tight shutoff even at low-pressure drops. RPTFE is the standard seat insert, with other soft seat materials such as PEEK and KTM's E-Seat® [RPTFE/PFA Copolymer] are available for special applications. The typical seat retainer to body seal is FKM O-ring with other options including NBR, Aflas®, or PTFE U-ring to meet extended operating temperature or fluid compatibility requirements.

KTM SERIES E01

OPTIONS

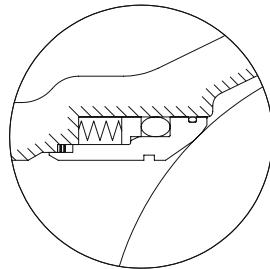

METALTITE® METAL SEATED OPTIONS

The KTM Metaltite® metal seat is available for more demanding applications such as high temperature, abrasive, slurries, etc. The standard Metaltite® Seat is stellited overlay on a 316 SS seat retainer against a 316 SS ball with hard (HRC 56-60) nickel alloy overlay. Seat options include high temperature and scraper seats, depicted below. Combinations of hard ball coating/overlays, hard seat overlays and seal options cover a wide range of applications as shown below. See KTM Metaltite® literature for additional information.

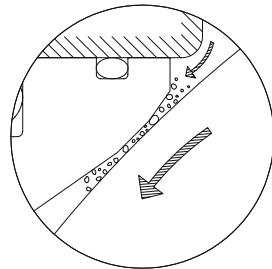

TRUNNION METAL TRIMS

Code	Hard-Facing	Standard Packing/Gasket/ Seat Retainer Seal	Max. Temperature	Application
AY	Ball: Hard chrome plated Seat: Stellited	PTFE/PTFE/PTFE O-Ring	Up to 150 °C (300 °F)	Moderately non-clean media such as slurries, pulp stock, and fluids containing solids. High cycle on-off, batching and switching processes.
AG	Ball: Hard chrome plated Seat: Stellited	Graphite/Graphite/PTFE U-ring	Up to 250 °C (482 °F).	Moderately non-clean media such as slurries, pulp stock, and fluids containing solids. High cycle on-off, batching and switching processes with fire safe design.
BY	Ball: Nickel alloy overlay Seat: Stellited with scraper	PTFE/PTFE/PTFE O-Ring	Up to 150 °C (300 °F)	More severe and abrasive media such as slurries, pulp stock, fluids containing solids. High cycle on-off, batching and switching processes.
BG	Ball: Nickel alloy overlay Seat: Stellited with scraper	Graphite/Graphite/PTFE U-ring	Up to 250 °C (482 °F).	More severe and abrasive media such as slurries, pulp stock, fluids containing solids. High cycle on-off, batching and switching processes with fire safe design.
BX	Ball: Nickel alloy overlay Seat: Stellited with scraper	Graphite/Graphite/Graphite	Up to 500 °C (932 °F).	Most severe, highest temperature media such as steam, hot gases and thermal fluids. Higher-frequency and higher-pressure on-off, batching and switching processes with fire safe design. Fluids containing solids and solid / powder handling.

METALTITE® AY/AG TRIMS WITH LINE CONTACT SEATING

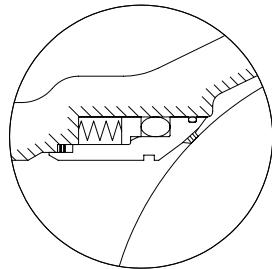

Typical metal seats have a line contact between ball and seat.

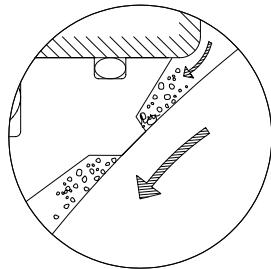

Abrasive applications or applications where buildup of media can occur reduces sealing performance.

METALTITE® BY/BG/BX TRIMS WITH SCRAPER SEATS

KTM Scraper seats are designed to prevent build up of material on the surface the ball.

Minimize residual material by mechanically scraping the seats, ensuring maximum sealability.

BONNET EXTENSION FOR CRYOGENIC, LOW OR HIGH TEMPERATURE

Extension bonnets are available which isolate both the stem packing and valve operator/actuator from the process in cryogenic, low or high temperature applications. This allows the stem packing and gear or powered actuator to operate at less extreme temperatures, prolonging the life of both. At cold and cryogenic temperatures, the extension isolates the packing and stem from the 'ice ball' that can form around the valve ensuring optimal performance. E1 extended bonnets are 125, 150, 175, 200, or 300 mm [5, 6, 7, 8, or 12 inches], E2 extended bonnets are 250, 300, 350, or 400 [10, 12, 14, or 16 inches] depending on valve size and pressure class. See KTM Cryogenic literature for additional information.

NOTES

Consult factory for dimensions not shown.

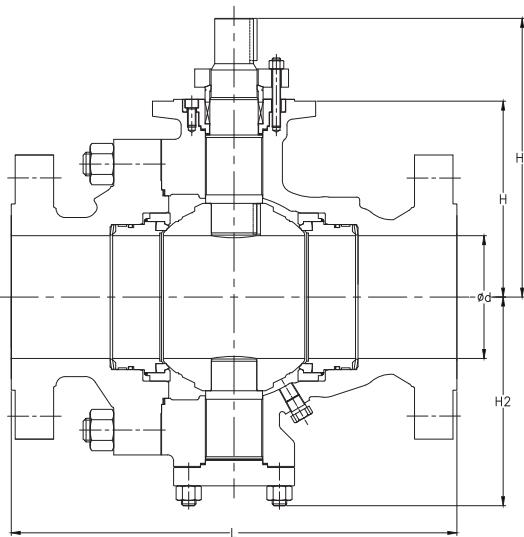

Face-to-face dimensions for E01 Class 300 reduced bore valves with size

DN 200 - 250 [NPS 8 - 10] are complied with ASME B16.10 short pattern.

KTM SERIES E01

KTM SERIES E01

PRESSURE AND TEMPERATURE CURVES

PRESSURE - TEMPERATURE CURVES

CLASS 150, 300 AND 600

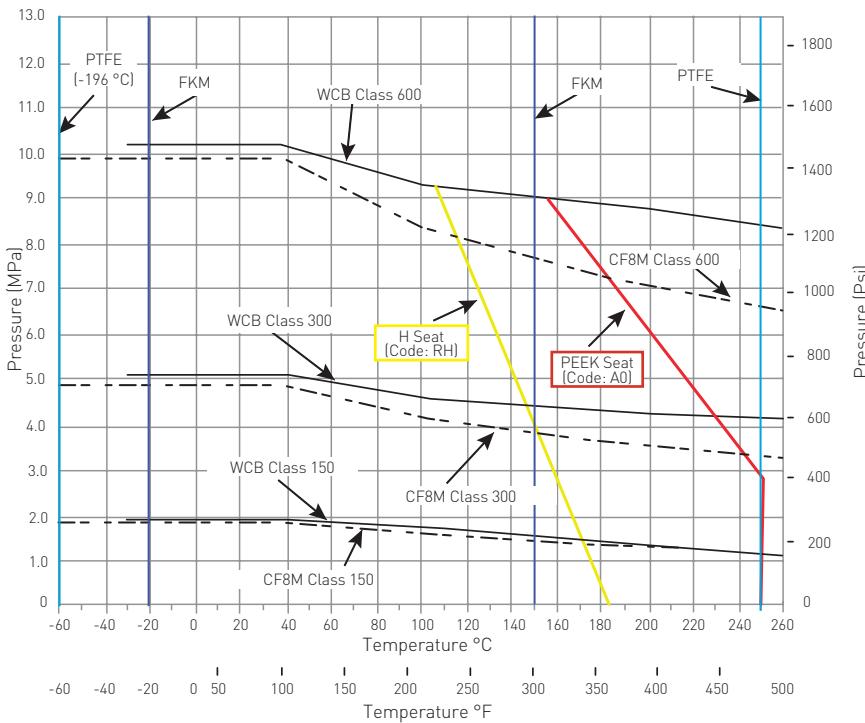

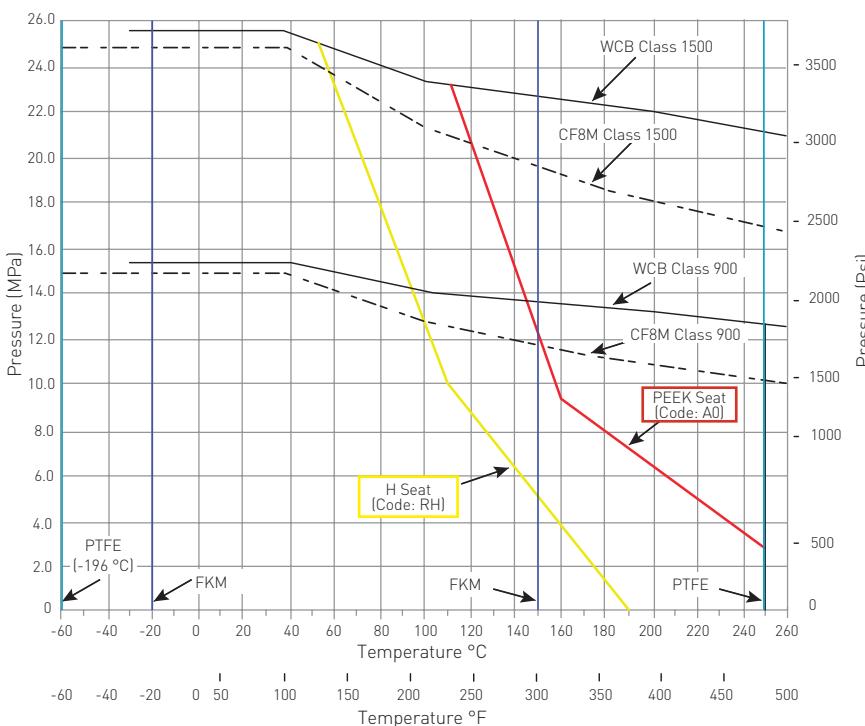

TABLE 6 - Packing, gasket and seal material temperature considerations

Material	Min. Temp.	Max. Temp.
FKM (Viton O-ring)	-20 °C (-4 °F)	150 °C (302 °F)
PTFE U-ring	-196 °C (-320 °F)	250 °C (482 °F)
NBR O-ring	-30 °C (-22 °F)	80 °C (176 °F)
FEPM (Aflas®)	N/A	200 °C (392 °F)
FFKM (Kalrez®)	N/A	260 °C (500 °F)
Low temp. NBR	-46 °C (-51 °F)	80 °C (176 °F)
FVMQ (Fluorosilicone)	-45 °C (-49 °F)	120 °C (248 °F)

CLASS 900 AND 1500

NOTES

- For trunnion valve high temperature and metal seated pressure / temperature curves, see the Metaltite® Technical Data Sheet.
- For trunnion valve low temperature and cryogenic pressure / temperature curves, see the Cryogenic Technical Data Sheet.
