DEMCO Gate Valves

Oklahoma City,
Okla., USA

Cameron is a leading provider of valves, valve automation, and measurement systems to the oil and gas industry. Our products are primarily used to control, direct, and measure the flow of oil and gas as it is moved to refineries, petrochemical plants, and industrial centers for processing.

We provide valve products that are sold through distributor networks worldwide for use in both oil and gas and industrial applications and include such widely recognized brands as DEMCO®, NAVCO®, NEWCO®, NUTRON®, THORNHILL CRAVER®, TECHNO™, TOM WHEATLEY®, WHEATLEY®, and WKM®.

Cameron's DEMCO gate valves are the valves of choice, engineered and proven for drilling and production industries. Designed for dependable, heavy-duty performance in abrasive and corrosive service conditions, DEMCO gate valves are commonly selected for a number of oilfield applications.

SERIES DM GATE VALVES

Cameron's DEMCO Series DM gate valves, the premier gate valve in the oil and gas drilling market, are specifically engineered for the rigorous requirements of oilfield applications. Designed for dependable, heavy-duty performance in abrasive service conditions, DEMCO DM gate valves are commonly selected for a number of oilfield applications, including:

- Drilling standpipe manifold
- Pump manifold block valves
- High-pressure mud mixing lines
- High-pressure drilling system block valves

The DEMCO Series DM gate valves are available in ASME Classes 600, 900, and 1500. They also are available in API working pressures 2000, 3000, and 5000 psig (not API monogrammed).

Features and Benefits

In-Line Field Repairability

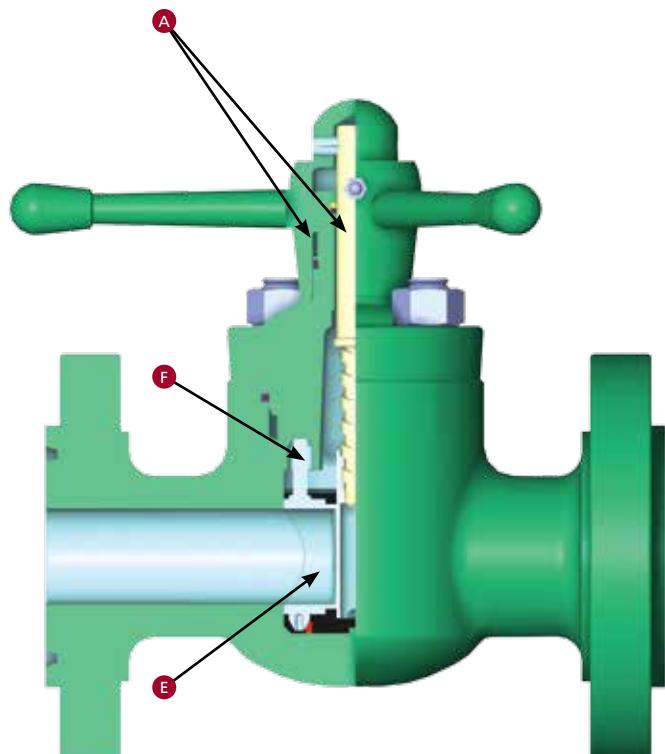

The bonnet is easily removed for internal parts inspection and/or replacement without removing the valve from the line. This design simplicity permits fast and easy service without the need for special tools.

Flexible Trim Offerings

Optional materials for stems, gates, seat inserts and seat elastomers make it easier to trim valves for a wide range of service conditions. Three internal plastic coatings for the body and bonnet are offered to improve resistance to wear and corrosion.

Double Acting Thread Design for Fast Operation

- A. The ASME series double acting thread design contains a threaded stem in the gate working with threads in the bonnet and handle assembly. Stems are polished and include a dependable O-ring and anti-extrusion seal. This unique design is economical and effective. Note: the 4" (100 mm) ASME Class 1500 valve is a double acting, rising stem design, similar to the 4" (100 mm) 3000 psi valve.
- B. The DM 2000, 3000, and 5000 psig working pressure valves contain double acting threads working together in a specially designed stem screw, screw housing, and stem arrangement. Note: the 4" (100 mm) and larger 5000 psi valve is a single-thread, heavy-duty, rising stem design with bearings.
- C. The rising stem design protects the stem threads from the lading.
- D. Larger DM 3000 and 5000 psi gate valves include a sight lens to view the stem for determining gate position.

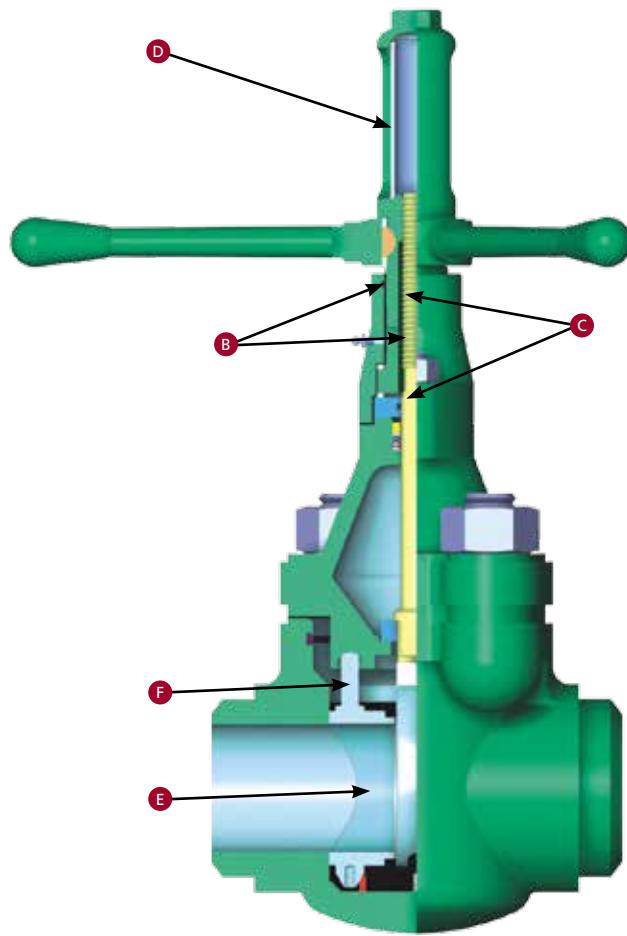

Series DM 3" (80 mm) ASME 900/1500
Gate Valve

SERIES DM 1000 TO 5000 PSI GATE VALVES

Exclusive Seat Design for Drop-Tight Sealing

The DEMCO Series DM gate valve seat uses a unique design to provide a drop-tight shutoff in abrasive and erosive service.

- E.** The seat consists of two identical metal wear rings encapsulated in elastomer to form a cylindrical shape with a gate slot and two round ports. The closed gate bears on the downstream wear ring, while the elastomer provides a drop-tight pressure-responsive seal around the port.
- F.** The cylindrical seat assembly fits into the machined body cavity and is expanded outward toward the valve ports by the bonnet and spread ring in the bottom of the seat. The expansion occurs when the bonnet is tightened onto the body while engaging the seat pin extensions from both wear rings. The spread ring ensures the seat elastomer presses uniformly against the body bore. This design ensures the seat seals tight against the body and around each valve port. This design has proven to be effective even if the gate and seat ring become scored or abraded during service. When it comes time for maintenance, the seat's single-piece design makes it easy to pull out of the body for replacement.

Series DM 4" (100 mm) 5000 WP
Gate Valve (Four-Bolt Design Shown)

For proper valve repair, use Cameron's DEMCO replacement parts.

SERIES DM 7500 PSI GATE VALVES

Features and Benefits

In-Line Field Repairability

The bonnet is easily removed for internal parts inspection and/or replacement without removing the valve from the line. This design simplicity permits fast and easy service without the need for special tools.

Heavy-Duty Roller Bearings

Heavy-duty stem roller bearings reduce torque on 4" (100 mm) and larger valves.

Floating Slab Gate Design

A slab gate with a "T" slot stem connection allows the gate to float to the seat, providing a tighter pressure-responsive seal.

A. Unique, abrasion resistant, one-piece seat design

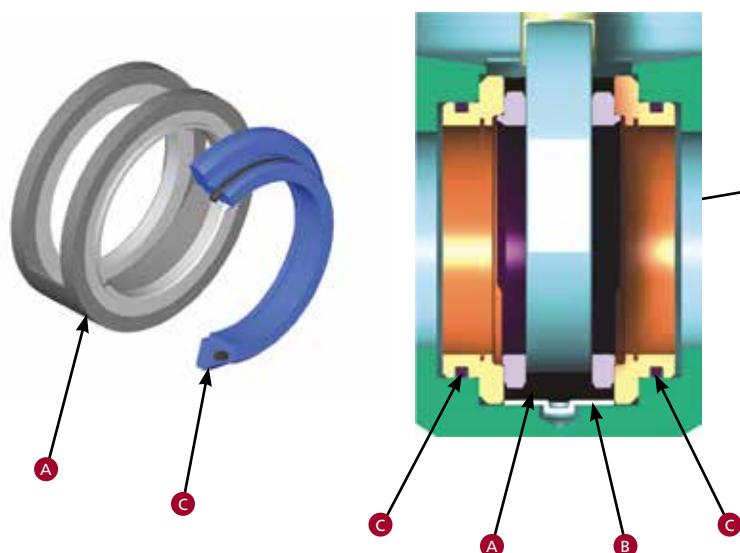

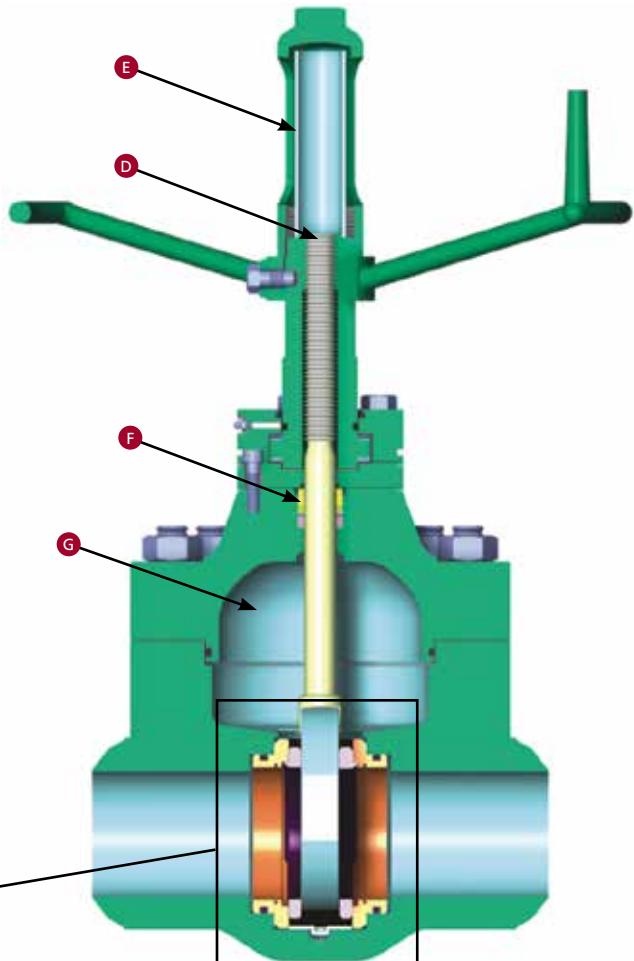

The seat assembly consists of two stainless steel insert support rings to which a resilient elastomer is permanently bonded. The elastomer provides tight shutoff after long use in abrasive service. The stainless steel rings are corrosion and erosion resistant. The one-piece design makes field replacement easier.

B. Locking seat alignment

The seat assembly is engineered with a metal lock shell that aligns the seat in the bottom of the valve. This design ensures accurate seat alignment with reduced resistance to flow.

C. Body wear rings

Surface hardened alloy body wear rings back up both sides of the seat. These rings extend the service life of the valve by absorbing erosive wear that can cause damage to the body around the seat bore area.

D. Rising stem design

The DEMCO DM 7500 gate valve uses a rising stem design that isolates and protects the threads from the line medium. The rising stem also indicates gate position.

E. Visual position indicator lens

On 3" (80 mm) and larger valves, a clear position indicator lens allows the operator to easily determine whether the valve is open or closed. The indicator lens also helps to protect the stem threads from the elements.

F. Replaceable stem packing

The stem packing can be replaced without removing the bonnet from the valve, 3" to 6" (80 mm to 150 mm), saving time when this maintenance may be required. Note: line and valve pressure must be relieved before performing this maintenance.

G. Flow cleansed design

The body cavity area is designed to allow continuous flushing by the fluid flow. This action prevents the valve from sanding up, even in standpipe installations.

SERIES DT/DB GATE VALVES

Cameron's DEMCO Series DT/DB gate valves are recognized for their quality design, rugged dependability, and corrosion resistance, particularly for use in waterflood and CO₂ applications.

DEMCO aluminum bronze and stainless steel valves and accessories are designed specifically for the demanding requirements of corrosive CO₂ injection and waterflood applications in the enhanced oil recovery market.

- The handle moves up and down on the bonnet, or the top of the stem is visible during operation, providing visible aid to determine whether the valve is open or closed.

SEE PAGES 36 THROUGH 43 FOR MATERIAL SPECIFICATIONS

Optional Materials:

DT Series:

- SS Body and Bonnet,
FKM or P-10 Seats

DB Series:

- FKM Seat Elastomer
- Peroxide-Cured Buna-N

Features and Benefits

In-Line Field Repairability

The bonnet is easily removed for internal parts inspection and/or replacement without removing the valve from the line. This design simplicity permits fast and easy service without the need for special tools.

Corrosion-Resistant Materials are Standard

Body and bonnet materials, as well as all internal wetted parts, comply with NACE RP-0475.

Rising Stem Design

The handle moves up and down on the bonnet, or the top of the stem is visible during operation, providing visible aid to determine whether the valve is open or closed.

A. Pressure-responsive drop-tight sealing

Standard seats consist of 316 SS seat rings encapsulated with peroxide-cured Buna-N elastomer to provide reliable, drop-tight sealing for extended service life.

B. Superior abrasion resistance

Buna-N elastomer encapsulated seats also provide an excellent deterrent to abrasion, further enhancing extended service life.

C. Four-ring stem packing set

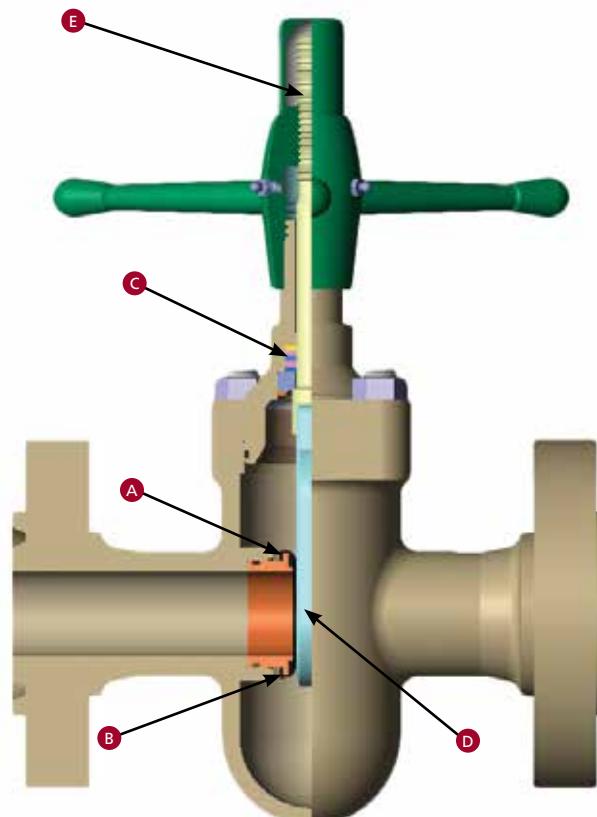

The DEMCO Series DT seal design uses four packing rings, preventing leakage into the stem journal and outside the valve.

D. Through-conduit gate design

Full through-conduit design ensures non-turbulent flow and gate alignment for improved valve performance and longer service life.

E. Non-wetted stem thread design

The DEMCO stem design isolates corrosive lading from contacting stem threads, preventing stem seizure and ensuring long, trouble-free valve performance.

Series DT Gate Valves

For proper valve repair, use Cameron's DEMCO replacement parts.

Series DB Gate Valve

The DEMCO Series DB gate valve is available for the large 6" (150 mm) and 8" (200 mm) pipe sizes in the enhanced oil recovery market. These valves also feature an aluminum bronze body and bonnet as standard. Internal parts are 316 SS. The exclusive seat design of the DEMCO Series DB gate valve is the same proven design found in the DEMCO Series DM gate valve. The seat consists of two identical metal wear rings encapsulated in elastomer to form a cylindrical shape with a gate slot and two round ports. The closed gate bears down on the downstream wear ring, while the elastomer provides a drop-tight pressure-responsive seal around the port. This design provides an effective seal even if the gate and seat ring become scored or abraded during service. The DEMCO Series DB gate valve also is field repairable while the valve is in-line.

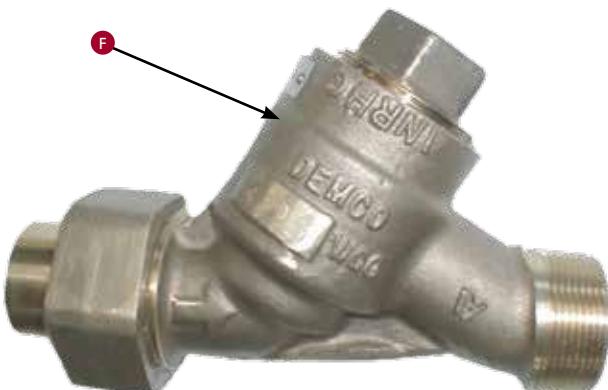

ENHANCED OIL RECOVERY ACCESSORIES

Accessories

Ball check valves, flow tees, and strainers are available to complete requirements for an entire injection assembly.

SERIES DM, DT, AND DB GATE VALVES GENERAL TECHNICAL INFORMATION

Valve Size Designations and Weld End Dimensional Information

1. All references to pipe size in this catalog are the nominal size.

The actual OD and ID for various nominal sizes and schedules are tabulated below.

Weld end bodies are machined at each end to match the pipe OD and ID.

Nominal Size			ID			
in.	(mm)	OD	Sch 40	Sch 80	Sch 160	XXH
1-1/2	(40)	1.900	1.610	1.500	-	-
2	(50)	2.375	2.067	1.939	1.687	1.503
2-1/2	(65)	2.875	2.469	2.323	2.125	1.771
3	(80)	3.500	3.068	2.900	2.624	2.300
4	(100)	4.500	4.026	3.826	3.438	3.152
5	(125)	5.563	-	4.813	4.313	4.063
6	(150)	6.625	6.065	5.761	5.187	4.897

2. Reduced port valve size descriptions are designated by two numbers.

The first number is the nominal size of the end connection.

The second number is the ID of the valve seat (dimension "C" in the tables).

PRESSURE RATINGS

DEMCO gate valves are designed for the maximum working pressures and test pressures tabulated below.

ASME Class 600	ASME Class 900	ASME Class 1500	1000	2000	3000	5000	7500
			WP	WP	WP	WP	WP
1480 WP	2220 WP	3705 WP	1000 WP	2000 WP	3000 WP	5000 WP	7500 WP
2225 Test	3350 Test	5575 Test	2000 Test	4000 Test	6000 Test	7500 Test	11,250 Test

Gate valve rating must be selected to match the piping system in which the valve will be installed. Tabulated below are working pressures at 100° F (38° C) for ASTM A106 Grade B and AISI 4130 60K minimum yield pipe in sizes corresponding to DEMCO gate valves.

Size		ASTM A106 Grade B				4130 60k Min. Yield
in.	(mm)	Sch 40	Sch 80	Sch 160	XXH	XXH
1-1/2	(40)	1340	2430	-	-	-
2	(50)	1210	2220	4300	5970	10,234
2-1/2	(65)	1620	2590	3950	6590	-
3	(80)	1460	2370	3930	5880	10,080
4	(100)	1300	2130	3830	5150	8826
5	(125)	-	1970	3730	4650	7971
6	(150)	1110	1970	3650	4724	8098
8	(200)	1030	1790	-	-	-

Quality, Inspections and Testing

- Cameron's quality system is based on ISO 9000 and API Q1 requirements and is ISO 9001:2008 certified. Cameron's Quality department monitors all phases of valve production, from material receipt to final inspection, including a liaison with third-party inspectors and certifying authorities.
- All DEMCO gate valves are hydrostatically tested; stem seal, body and seat are inspected for zero leakage under pressure before being released for shipment. Hydrotest specifications are based upon API 6A latest edition testing requirements; DEMCO Series DM 7500 group 2 and 3 valves undergo additional test cycles, including low-pressure seat tests prior to being released for shipment.

Certifications

- DEMCO DM 5000 Gate Valves 2" to 5" are available with ABS Type approval upon request.
- DEMCO DM 7500 Gate Valves 2" to 5" are available with ABS or DNV Type approval upon request.

Seat Seal Options

- **Buna-N (Nitrile)**
Is excellent for petroleum oil and gases, fuel oils, and alcohols from -10° F to 200° F (-23° C to 93° C).
- **FKM**
Highly resistant to mineral acids and hydrocarbons and resists moderate concentrations of H₂S. Serviceable from -10° F to 400° F (-23° C to 204° C). (Not suitable for steam).
- **HNBR**
Formulated for use with synthetic and oil-based drilling mud service from -20° F to 250° F (-29° C to 121° C).

Coatings – DM Gate Valves Only

- **DEMCO 12 (Internal Coating only)**
A baked-on phenolic epoxy, tougher and more abrasion resistant. Excellent for service in caustics and saltwater up to 200° F (93° C).
- **ENDURO-BOND™ (For Internal and External use)**
An engineered dry powder coating process for metal surfaces that provides a protective barrier against corrosion and abrasive wear. Coating thickness is from 1 to 4 mil; is superior to plastics, epoxies and ceramics; and has a high heat resistance to 800° F (427° C).

Ordering Information

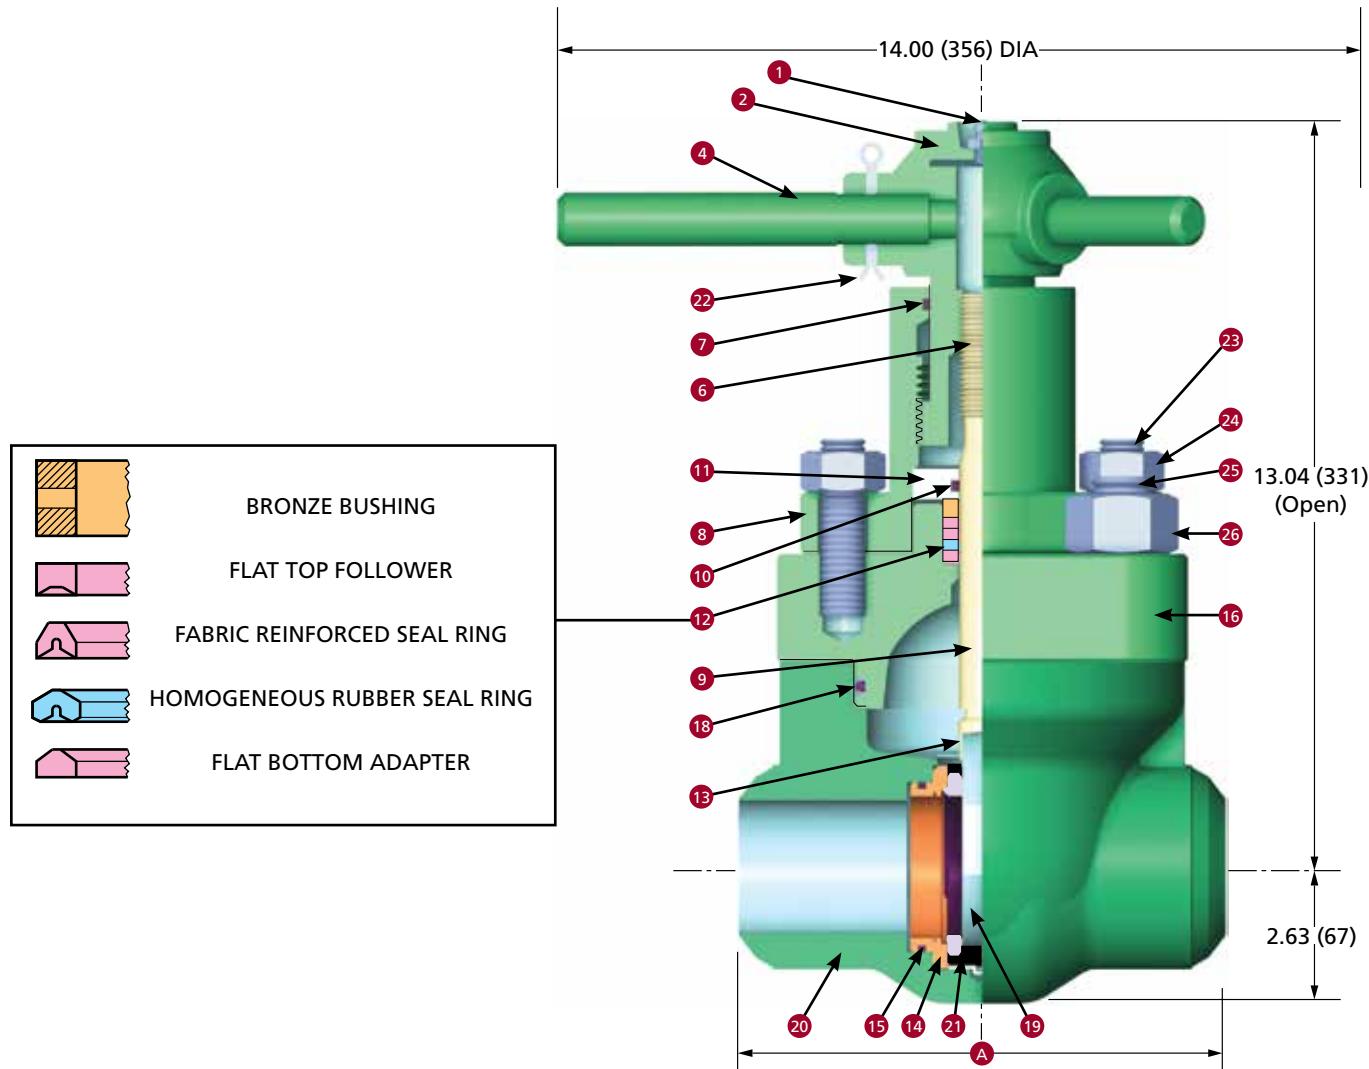

- Give size, pressure class, and end connection.
- Specify pressure class of flanged ends, raised face (RF), or ring type joint (RTJ).
- For threaded ends, provide type of pipe:

TBG (non-upset tubing)	LCSG (long casing thread)
UPTBG (external upset tubing)	CSG (short casing thread)
- For weld ends, give schedule of mating pipe.
- For applications in high-pressure gas above 3000 psi or involving concentrations of H₂S or CO₂, consult Cameron for recommendations.

Dimensions and Materials/Parts List

SERIES DM 7500 GATE VALVES – 7500 PSI WP

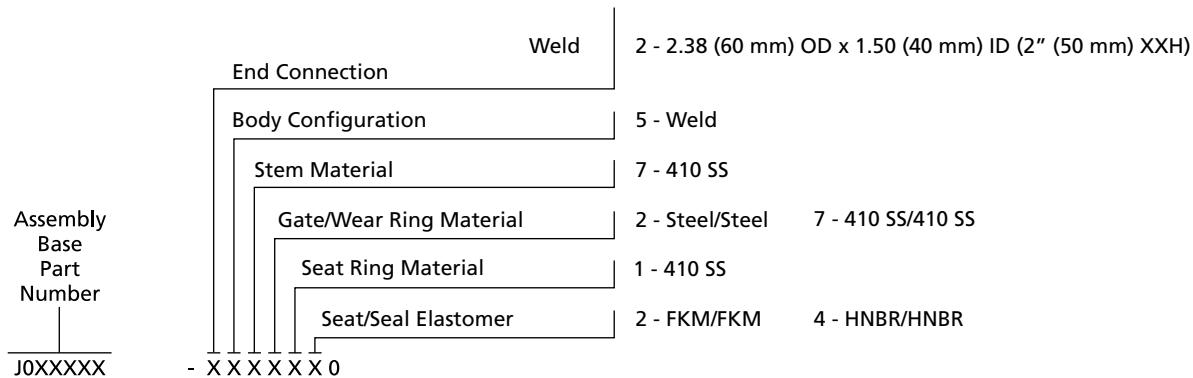

2" (50 mm) XXH with 1-1/2" (40 mm) Bore

Dimensional Data and Weights

Dimension	Valve Size: 2" (50 mm) RP 7500 WP
A Weld End	9.00 (229)
Valve Seat ID	1.50 (40)
Number of Handle Turns from Open to Closed	7.00
Weight lb (kg)	
Weld End	76 (34)

ASSEMBLY PART NUMBER

- Group 1** Basic valve. Hydrostatic shell test: 11,250 psi for three minutes. Hydrostatic seat test: 7500 psi for three minutes, each side. Material traceability on body and bonnet.
- Group 2** Same as Group 1, except: Hydrostatic shell test: 11,250 psi for three minutes, drop to 0 psi, then 11,250 psi for 15 minutes. Test is charted. Hydrostatic seat test: 7500 psi for three minutes, drop to 0 psi, 7500 for 15 minutes, drop to 0 psi, then 300 psi for five minutes, each side. Test is charted. Material traceability on body, bonnet, stem, and bolting. Impact tests at or below -50° F (-46° C) on body, bonnet, stem and bolting. Surface NDE on body, bonnet and stem.
- Group 3** Same as Group 2, plus volumetric NDE on body and bonnet.

SERIES DM 7500 GATE VALVES – 7500 PSI WP

3" (80 mm) Full Port

Dimensional Data and Weights

Dimension	Valve Size: 3" (80 mm) FP 7500 WP
A Weld End	13.00 (330)
Flanged End, API Length	24.38 (619)
Valve Seat ID	
For Flanged Ends	3.00 (80)
API Ring Number	BX-154
Flange ID	3.06 (78)
Flange OD	10.62 (270)
Flange Bolts (Qty., Size: in.)	8 – 1
Number of Handle Turns from Open to Closed	16.01
Weight lb (kg)	
Weld End	256 (116)
Flanged End	372 (169)

ASSEMBLY PART NUMBER

- Group 1** Basic valve. Hydrostatic shell test: 11,250 psi for three minutes. Hydrostatic seat test: 7500 psi for three minutes, each side. Material traceability on body and bonnet.
- Group 2** Same as Group 1, except: Hydrostatic shell test: 11,250 psi for three minutes, drop to 0 psi, then 11,250 psi for 15 minutes. Test is charted. Hydrostatic seat test: 7500 psi for three minutes, drop to 0 psi, 7500 for 15 minutes, drop to 0 psi, then 300 psi for five minutes, each side. Test is charted. Material traceability on body, bonnet, stem and bolting. Impact tests at or below -50° F (-46° C) on body, bonnet, stem, and bolting. Surface NDE on body, bonnet and stem.
- Group 3** Same as Group 2, plus volumetric NDE on body and bonnet.

Services for Valves and Actuation

WE BUILD IT. WE BACK IT.

Startup and Commissioning

Our experts understand that each project is unique. That's why Cameron's services help facilitate commissioning and start-up activities.

- Integrated solutions, onsite or at our global service centers
- Increased equipment and product performance
- The shortest possible trouble-free startup for your critical assets

Spare Parts and Asset Management

Cameron offers the assets and expertise to cover all aspects of valve management.

- Full inventory of quality exact OEM parts and spares
- Complete asset risk and criticality assessments
- Comprehensive inventory of your assets, including a complete recommended spare valves and parts list

Operational Support

Cameron's ability to address valve requirements in the field is a reflection of our commitment to life-of-asset support.

- Innovative asset management solutions
- Trouble-free installation, startup and operations
- Support from commission to operation – extending through all phases of a valve's life cycle
- Extensive inventory of spare valves and parts

Cameron's site management team helps mitigate the risk of project delays by identifying issues in the construction process prior to valve installation to ensure valve integrity.

DEMCO Butterfly Valves

Oklahoma City,
Okla., USA

Cameron is a leading provider of valves, valve automation, and measurement systems to the oil and gas industry. Our products are primarily used to control, direct and measure the flow of oil and gas as it is moved to refineries, petrochemical plants, and industrial centers for processing.

We provide valve products that are sold through distributor networks worldwide for use in both oil and gas and industrial applications and include such widely recognized brands as DEMCO®, NAVCO®, NEWCO®, NUTRON®, THORNHILL CRAVER®, TECHNO™, TOM WHEATLEY®, WHEATLEY®, and WKM®.

Cameron's DEMCO butterfly valves are the valves of choice, engineered and proven for drilling and production industries. Designed for dependable, heavy-duty performance in abrasive and corrosive service conditions, DEMCO butterfly valves are commonly selected for a number of oilfield applications.

FEATURES AND BENEFITS

As one of the most durable resilient-seated butterfly valves in the industry, Cameron's DEMCO butterfly valve excels in a variety of applications.

Cast in both wafer and tapped lug patterns in a variety of material choices, DEMCO butterfly valves feature a one-piece body for reduced weight and increased strength.

The unique stem hole design in the disc ensures the dry stem journal, and the hard-backed seat allows ease of installation, reliable operation and in-field repairability without special tools. DEMCO butterfly valves are available in sizes 2" to 36" (50 mm to 900 mm).

Engineered for long-term, reduced-maintenance performance, DEMCO butterfly valves are commonly selected for a variety of applications in the following industries:

- Chemical and petrochemical
- Agriculture
- Oil and gas drilling and production
- Food and beverage
- Water and waste water
- Cooling towers (HVAC)
- Power
- Mining and materials
- Dry bulk handling
- Marine and government

Bi-Directional Sealing

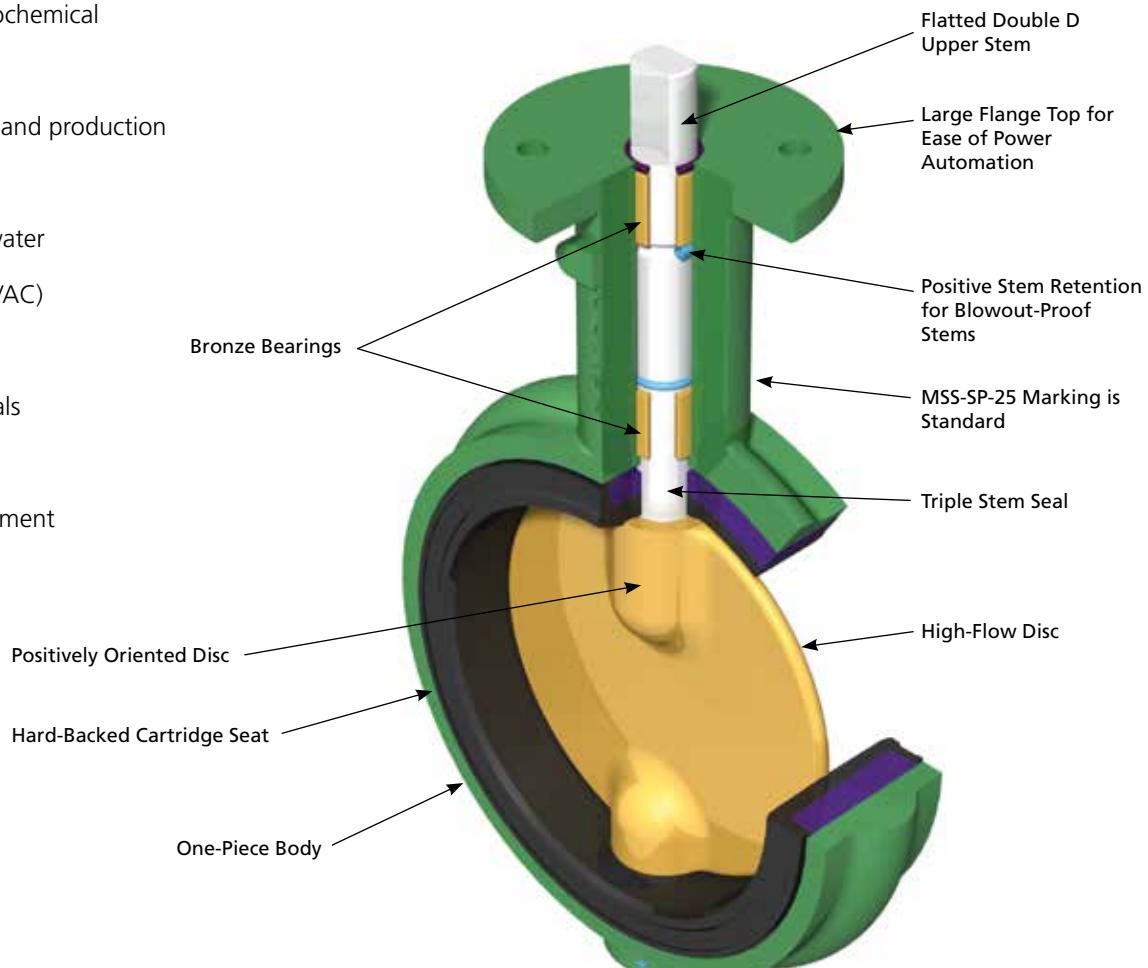

Cameron's DEMCO butterfly valve provides bi-directional sealing at full-rated pressure with identical flow from either direction.

Integral Flange Seal

An integral flange seal molded into the edge of the seat accommodates ASME weld neck, slip-on, threaded, socket and stub end type C flanges.

ASME Class 150 Rating

With a body rating of ASME Class 150 (285 psi non-shock), the wafer body diameters are designed to self-center in the ASME Class 150 flange pattern.

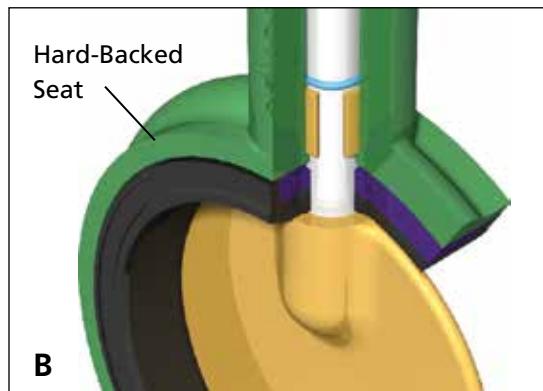

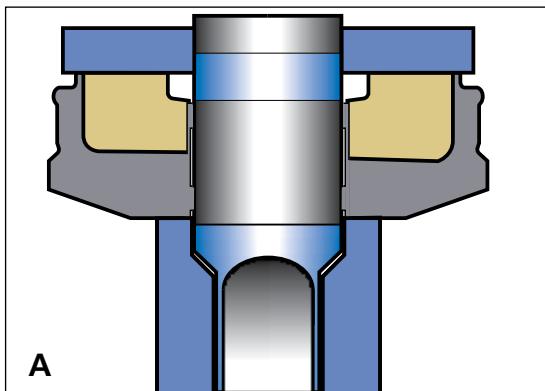

Wafer Style Shown

FEATURES AND BENEFITS (CONT.)

Multiple Pressure Ratings

Three drop-tight pressure ratings are offered for 2" to 12" (50 mm to 300 mm) sizes. The standard shut-off pressure rating is 200 psi, but 285 and 50 psi shut-off ratings are also available. A throttling 0 psi-rated valve is available where drop-tight closure is not required and minimal torque is desired. Both the 50 psi and throttling ratings allow for smaller actuators, which can significantly reduce overall installation cost in automated applications. The 14" to 36" (350 mm to 900 mm) size valves are available in 150 and 50 psi drop-tight shut-off ratings, as well as throttling.

A. Dry Stem Journal Reduces Potential for Leakage

The DEMCO valve's disc is uniquely designed with a continuous annular-raised band around the stem hole and disc edge, which presses into the seat flat at every angular position.

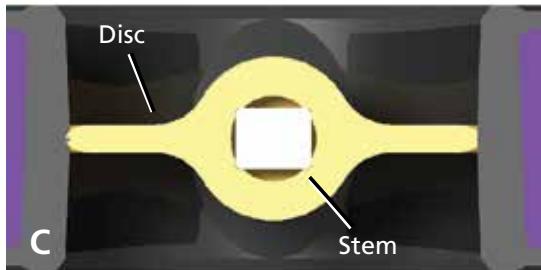

The resilient seat presses back with a higher force than the line pressure, preventing leakage to the stem. In addition, two O-ring ribs are provided in the seat stem bore, creating a triple stem seal. In competitive stem seal designs with boot seats, a seal is accomplished by an interference squeezing on the stem or an O-ring in the stem journal. The potential for leakage behind the seat is high for this competitive design. As the disc wipes the seat, elongation of the stem seal area allows leakage to collect behind the seat. This condition is reduced by the DEMCO valve's dry stem journal and hard-backed seat.

B. Hard-Backed Cartridge Seat

The DEMCO valve's cartridge seat is constructed by permanently bonding a resilient elastomer to a rigid backing ring. In addition to superior sealing integrity, this design:

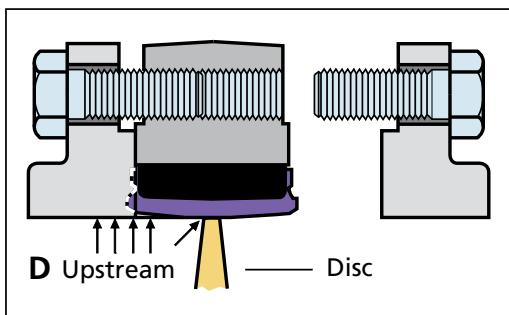

- Makes valve installation easier because no special precautions are required for disc position. This is especially advantageous when installing valves with fail-closed actuators.
- Reduces high torque and premature failure caused by elastomer distortion, as found in other non-rigid seat designs.
- Simplifies seat replacement because the seat is slip-fitted into the body with no need for special tools.

SPECIFICATIONS

C. Positively Oriented Disc

The rectangular drive ensures the proper orientation of the stem disc connection. In 2" to 24" (50 mm to 600 mm) size valves, the disc is permitted to float on the stem to center in the valve seat. This design enhances drop-tight sealing and prolongs service life.

D. End-of-Line Service

Lug body valves may be used in end-of-line service with downstream piping removed. Only weld-neck or socket flanges can be used for this service. Since upstream pressure is excluded between the flange and the seat face by the DEMCO flange seal design, there is no effective force to slide the seat downstream. DEMCO 2" to 12" (50 mm to 300 mm) lug butterfly valves are suitable for liquid service up to 200 psi with downstream piping removed at 150 psi for 14" to 36" (350 mm to 900 mm) valves.

Lug body valves are recommended for isolation of pumps, control devices or other system components, which may need to be removed for repair or replacement. Lug valves also are suitable for installation at points from which piping expansion may proceed. Such valves normally are blanked with blind flanges to protect the exposed seats until new piping is attached.

Sizes

2" to 36" (50 mm to 900 mm)

Body Type and Style Designations

Long-Neck NE-C and NF-C: 2" to 36" (50 mm to 900 mm) wafer/lug, 36" (900 mm)

Short-Neck NE-I and NE-I Sanitary: 2" to 12" (50 mm to 300 mm) wafer/lug

NE-IT Teflon: 2" to 10" (50 mm to 250 mm) wafer/lug

NE-D: 2" to 12" (50 mm to 300 mm) wafer

Marine: 2" to 24" (50 mm to 600 mm) wafer/lug

Pressure Rating

2" to 12" (50 mm to 300 mm):
0 (throttling); 50, 200 and 285 psi

NEI-T: 2" to 10" (50 mm to 250 mm): 150 psi
14" to 36" (350 mm to 900 mm): 0, 50 and 150 psi

Operating Temperatures

-30° F to 300° F (-34° C to 204° C), depending on seat material selection and application (see page 32)

Standard Material Options

Bodies: Iron, steel, stainless steel and bronze

Discs: Nickel-plated ductile iron, bronze and stainless steel

Stems: 416 and 316 stainless steel

Seats: Buna-N, EPDM, FKM and Neoprene

*Many more options available (consult Cameron or see pages 9, 10 and 11 on how to order).

STYLES AND ACCESSORIES

The DEMCO butterfly valve comes in a variety of styles to suit a range of applications. In addition, a variety of quality accessories are available to further enhance its suitability to the application.

Series NE-C

Sizes 2" to 12" (50 mm to 300 mm) are available in both wafer and lug styles. This series is a general purpose valve with a neck length designed to provide full clearance for the valve top over 2" of insulation on ASME Class 150 pipe flanges.

Series NE-I

Sizes 2" to 12" (50 mm to 300 mm) are suited for a range of applications in many industries, including food and beverage utilities and process flowlines. This short neck design is offered in a variety of body materials. The valves are designed for installation between ASME Class 125 and 150 flanges.

Series NE-D

The valves in this series can be made in sizes 2" to 12" (50 mm to 300 mm). The Series NE-D valve is a short-neck valve with body notches to fit popular, lightweight flange patterns, making it ideal for both the bulk material handling and the transportation industries. Valves also will center in ASME Class 125 and 150 flanges.

Series NF-C

Sizes 14" to 36" (350 mm to 900 mm) are available in both wafer and lug styles. The wafer body has two drilled locator lugs at the top and bottom for ASME Class 150 flanges. Bronze bearings are installed on both stems for reduced operating torque.

Series NE-I Sanitary

This series comes in sizes 2" to 12" (50 mm to 300 mm). It is similar to the Series NE-I valve, but is exclusively designed to meet the rigorous requirements of sanitary service in the food and beverage industry. The body is available in bronze, stainless steel, aluminum or electroless nickel-coated ductile iron.

FDA-approved materials are used for all wetted parts. Handle parts are bronze and stainless steel, permitting caustic washdown.

Other benefits:

- The DEMCO dry journal stem seal system ensures sanitary butterfly valve construction.
- Drilled passageways, a design originated by the DEMCO brand, vent the entire interior of the disc. No closed chamber is provided for the culture of undesirable organisms.
- Discs are produced from smooth and non-porous investment castings. Stem bosses are reduced for increased flow.
- The mating flange contacts and compresses the projecting inner surface of the resilient seat to form a smooth and uninterrupted flow way. This positive seal between the innermost contact of the seat and flange ensures aseptic conditions after a piping flush.

Sanitary Features

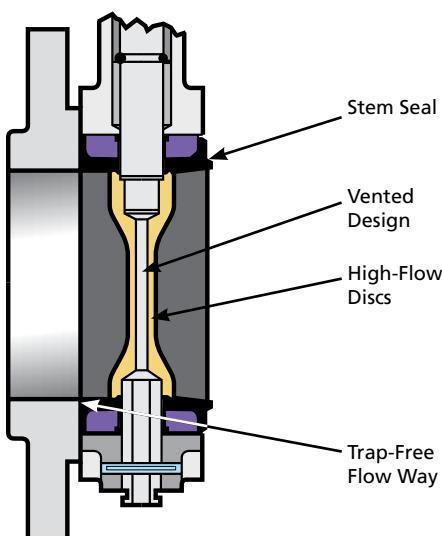

Series NEI-T Teflon

Because of the inert, aseptic, non-stick character of Teflon®, the DEMCO NEI-T Teflon-lined butterfly valve is ideal for clean lines in food and beverage plants. The Teflon seat consists of a virgin Teflon liner overlaid and bonded to an elastomer EPDM cushion, which provides resilience for sealing. The Teflon liner extends over the seat faces, completely covering and sealing the resilient material from contact with line fluids.

Marine

DEMCO marine butterfly valves are available in the NE-C lug, NE-I lug and wafer, and NE-D wafer styles, and conform to:

- Title 46 of the Code of Federal Regulations
- Part 56 of the US Coast Guard's Marine Engineering Regulations
- The American Bureau of Shipping Standard, including tagging per MSS-SP-25 and testing per MSS-SP-67

STYLES AND ACCESSORIES (CONT.)

A. Actuators

Consult Cameron or visit www.c-a-m.com/valveautomation for actuation options.

A. DEMCO NE-C Wafer

B. Handles and Stem Extensions

There are three basic handle designs that are compatible with any 2" to 12" (50 mm to 300 mm) valve: ten-position locking, two-position locking and memory stop. Memory-stop handles provide throttling, which is infinitely adjustable and can be set by a lock nut with a memory-stop setting (adjustable open stop). Handles are available in basic trim, corrosion-resistant trim and sanitary trim. Stem extensions are fabricated from carbon steel parts and contained in a tubular housing. Gaskets and O-rings seal the stem extension at the top and bottom. These extensions are fabricated to specified lengths.

B. Stem Extension with Handle on Series NE-I Butterfly Valve

C. Gear-Operated

C. Gear Operators

DEMCO weatherproof gear operators are offered with a choice of handwheel, chainwheel or square nuts. The worm gear has either self-locking set screws to control open and closed positioning or an optional adjustable memory-stop for balance return to a preset open position after closing.

MARINE SERIES

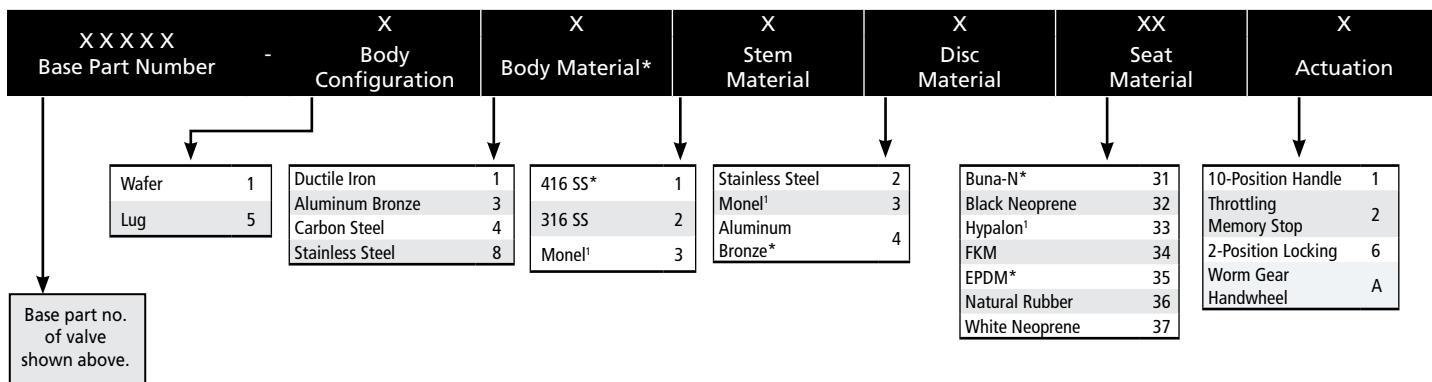

DEMCO marine butterfly valves meet all the requirements of US Coast Guard's Marine Engineering Regulations as outlined in Title 46 of the Code of Federal Regulations, Part 56 and The American Bureau of Shipping Standard, including tagging per MSS-SP-25 and testing per MSS-SP-67. All valves are shell tested at 1-1/2 times rated working pressure and seat tested at rated working pressure.

HOW TO ORDER

(Example: 6" (150 mm) 200 psi Wafer, Standard Trim with 10-Position Handle – 22928-1114311)

* Standard base trim options.

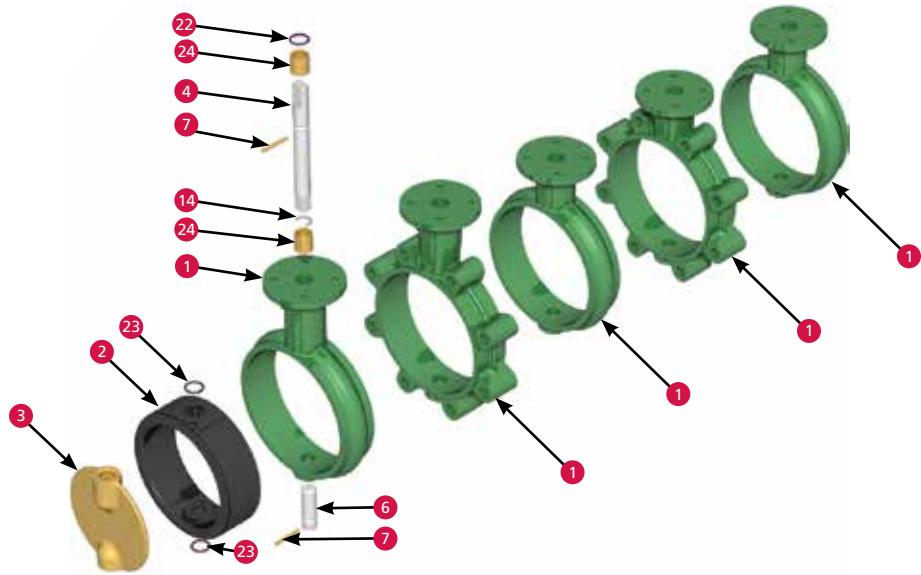

** Wafer 2" to 12" (50 mm to 300 mm) only.

Lug 2" to 36" (50 mm to 900 mm).

Note: 30" and 36" (750 mm to 900 mm) available with ductile iron lug body only.

1 See material trademark note on page 40.

1 EPDM seat options: Standard – Peroxide-Cured -135, Food Grade -035 Peroxide-Cured, Sulfur-Cured -235.

2 Alloy 20 not available for 285 psi.

3 8" to 12" (200 mm to 300 mm), 285 psi Aluminum Bronze, use -024.

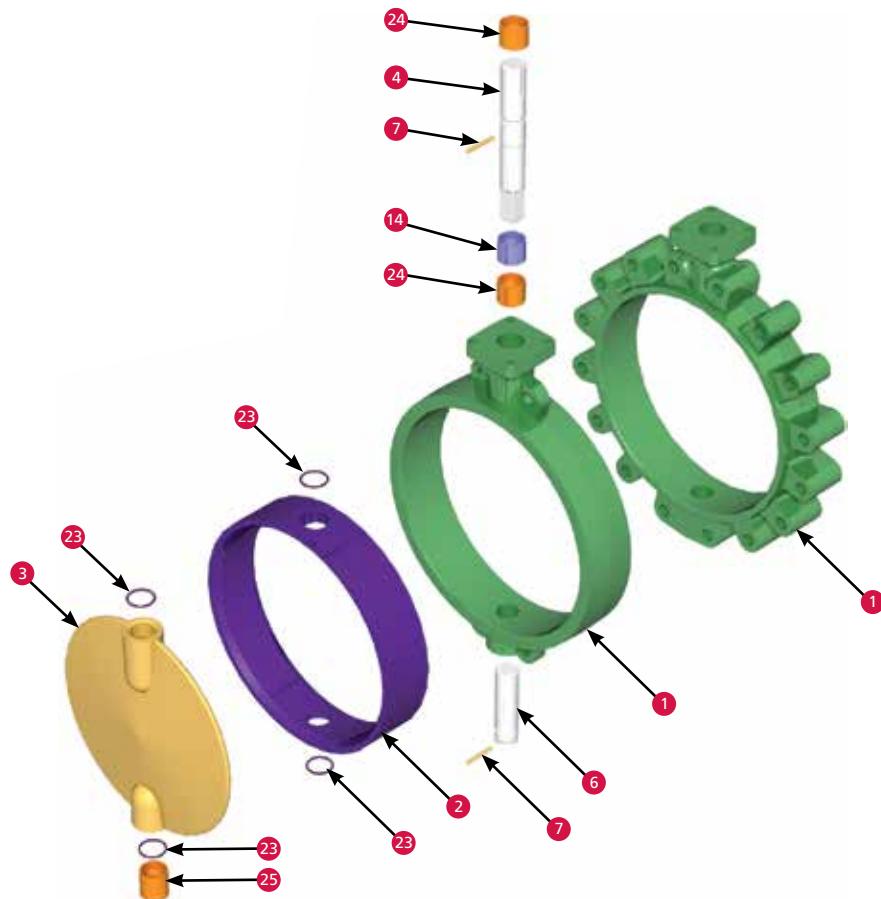

4 8" to 12" (200 mm to 300 mm), Upper Stem 17-4 PH SS (part number suffix -012), Lower Stem 316 SS.

5 Four required for throttling (0 psi) valves only.

6 3" (80 mm) NE-D seat part number 25095-xxx.

7 See material trademark note on page 40

WORM GEAR OPERATORS

Manual worm gear operators are self-locking in all positions. Adjustment screws stop travel at open and closed positions. Position indicator is standard on all models. Gearing is permanently lubricated.

Gray iron weatherproof case and cover enclose a ductile iron gear and hardened steel worm supported by bronze bearings. Standard external coating is green enamel. White epoxy, coal tar epoxy and inorganic zinc primer are available upon special request.

STEM EXTENSIONS

Fabricated from carbon steel, stem extensions are contained in a tubular housing. Lengths from 3" to 16 ft are fabricated to order. Torsional deflection of lengths greater than 16 ft require special design consideration and are available by special order only.

GENERAL TECHNICAL INFORMATION

Pressure Rating

Three drop-tight pressure ratings are offered for DEMCO butterfly valves. Normally, 200-psi shutoff is used in butterfly applications. However, 285-psi shutoff is optionally available for higher pressure applications. For smaller actuator sizing, 50-psi valves offer reduced torque.

For reduced torque, throttling valves, which do not provide drop-tight closure, are available.

Vacuum Rating

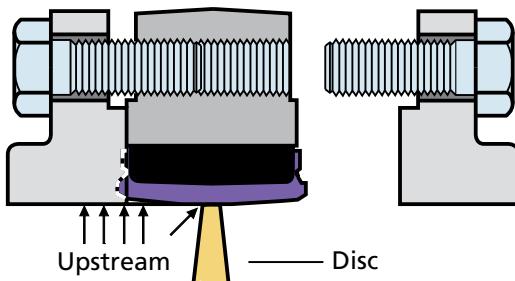

DEMCO butterfly valves will seal against 10 microns of vacuum (29.9 inHg). For reduced torque and extended seat life, 50-psi discs are recommended for the dry service conditions found in many vacuum applications.

End-of-Line Service

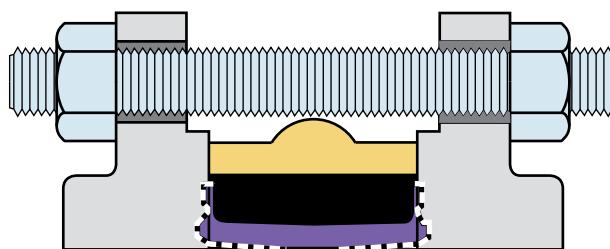

Lug body valves can be used in end-of-line service, with downstream piping removed. Only weld neck or socket flanges can be used for this service. Since upstream pressure is excluded between the flange and the seat face by the exclusive DEMCO flange seal, there is no effective force to slide the seat downstream. DEMCO lug butterfly valves are recommended for liquid service up to 200 psi with downstream piping removed.

Lug body valves are recommended for the isolation of pumps, control devices or other system components that may need to be removed for repair or replacement.

Lug valves also are suitable for installation at points from which piping expansions may proceed. Such valves normally are blanked with blind flanges to protect the exposed seats until new piping is attached.

Lug Valve Connection with Downstream Flange Removed

Wafer Valve Connection

Marking

Each valve is positively identified by marking and tagging per MSS-SP-25.

Actuation

Positive latch handles, worm gear operators and automatic actuators are available and interchangeable on the DEMCO valve.

The DEMCO top flange is dimensionally compatible with other competitive butterfly valves. With the optional "utility top" stem, the DEMCO valve interchanges directly with competitive valves, allowing valve replacement without the need for new actuation.

Installation and Maintenance

DEMCO butterfly valves are bi-directional, with identical flow way from either face. To install, simply close the valve, insert between flanges and make up with studs or capscrews. No regular maintenance or lubrication is ever required. Disassembly for inspection or replacement of parts is simple.

Open the valve, remove handle or actuator, remove tangential pins, pull out the stems, and push the disc and seat out of the body. Reassemble in reverse order, with a small amount of general purpose non-hydrocarbon based lubricant on the outside of stems, seat and disc flats.

Steel or cast iron flanges of either raised or flat-faced type are suitable for use with DEMCO butterfly valves. Plastic flanges are subject to damage at installation by over-tightening the bolting and may deflect or cup, resulting in flange leaks. Refer proposed plastic flange installations to Cameron's DEMCO brand quotations department for review and recommendation.

Throttling discs with no seat interference do not provide a stem seal. Stem O-rings are provided for this application. Flange gaskets assist the O-rings in 2" to 12" (50 mm to 300 mm) valves, and must be used only with throttling discs.

This nomograph gives corresponding values for the parameters of flow rate, valve size, disc angle and pressure drop of DEMCO butterfly valves in 1.0 specific gravity water service at 68° F (20° C).

The lower right-hand corner of the graph with the heavy line border represents line velocities below 15 ft/sec and normally is used for valve sizing in liquid applications.

Butterfly valves are economical throttling devices. Reliable throttling can be attained at disc openings from 25 to 70 degrees.

Sample Computation for Water

Water, with specific gravity of 1.0 and flow rate of 1200 gal/min, to 6" (160 mm) butterfly valve.

Required: Pressure drop at full and 75-degree disc openings. Project horizontally from 1200 gal/min to 6" (150 mm) valve curve. Project vertically upward to fully open valve curve, then horizontally to read 0.35 psi pressure drop. Continue upward projection to intersect 75-degree opening curve, then horizontally to read 0.8 psi pressure drop.

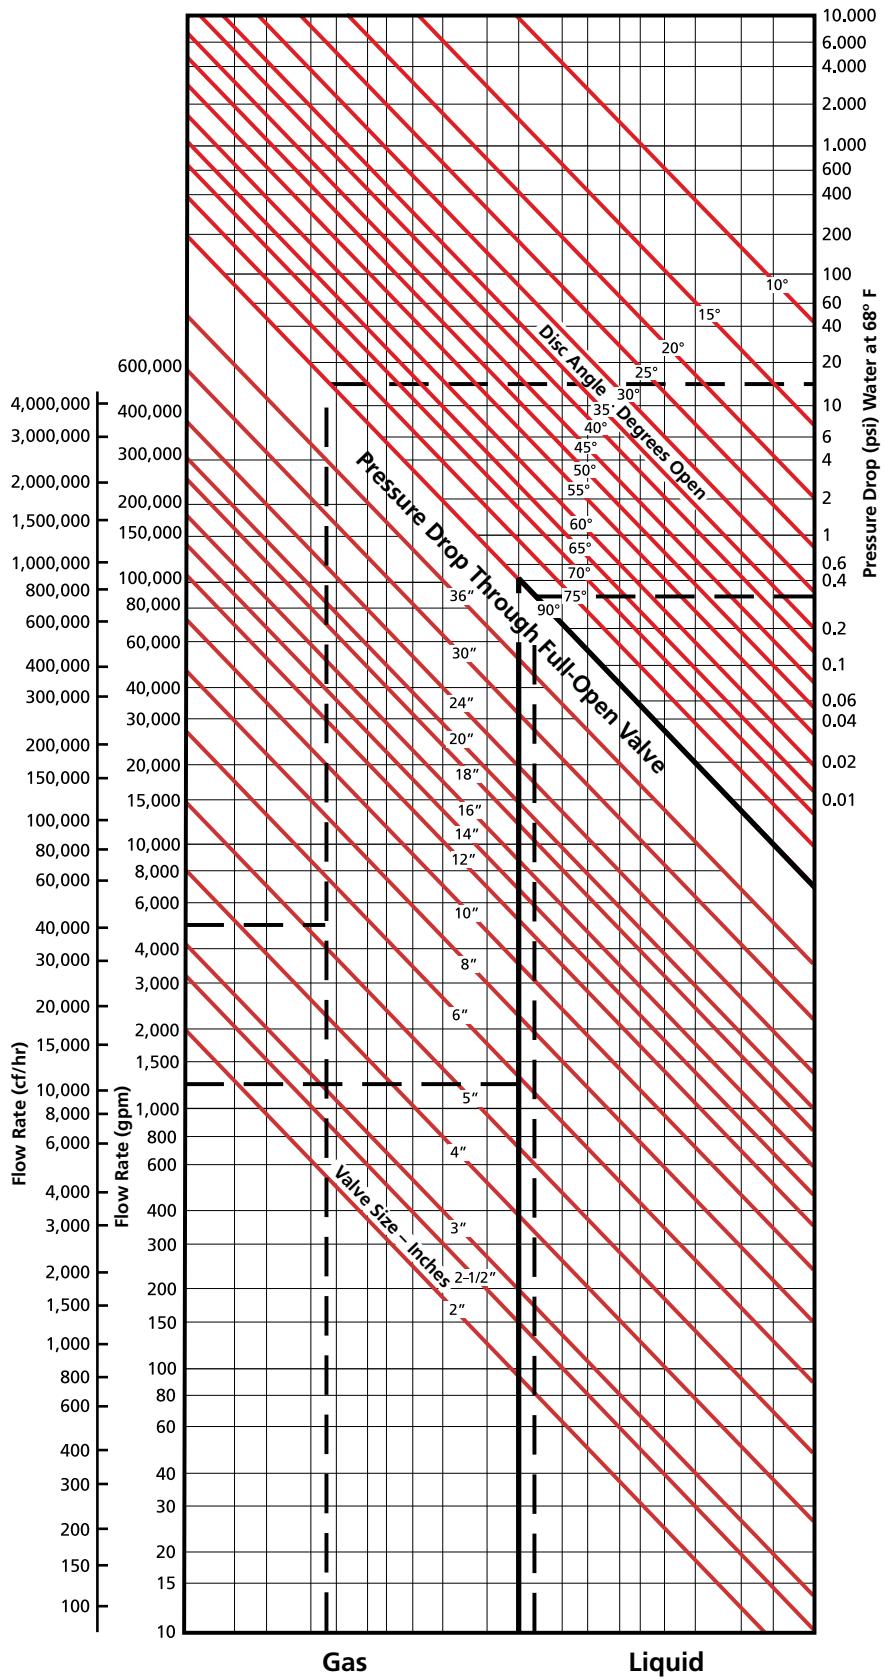

Sample Computation for Air

Air, with density of 0.217 lb/cf, flow rate of 40,000 cf/hr, to 5" (125 mm) butterfly valve.

Required: Pressure drop through fully open valve. Disregarding change in gas condition by pressure drop across valve, proceed from 40,000 cf/hr, as in liquid computation, to read 15 psi pressure drop. Convert pressure drop from water to air by multiplying this value times the ratio of air-to-water densities:

$$15 \text{ psi} \times \frac{0.217}{62.4} = 0.052 \text{ psi}$$

To determine pressure drop for any fluid, multiply value obtained from the nomograph by the quotient of the fluid density, in lb/cf, divided by 62.4.

C_v values, given above, may be employed in the formula:

$$Q = C_v \times \sqrt{\frac{\Delta P \times 62.4}{D}}$$

Where:

Q = gal/min of flow through the valve

ΔP = psi pressure drop across the valve

D = density of fluids in lb/cu ft

Pressure drop is computed by rearranging the formula to the following:

$$\Delta P = \frac{Q^2 \times D}{C_v^2 \times 62.4}$$

Sample Computations

What is the flow rate of water at ambient temperature through a 4" (100 mm) butterfly valve that is 70 degrees open when the pressure drop across the valve is 0.5 psi? (Density of water at 68° F is 62.4 lb/cu ft.)

$$\begin{aligned} Q &= C_v \times \sqrt{\frac{\Delta P \times 62.4}{D}} \\ &= 305 \times \sqrt{\frac{0.5 \times 62.4}{D}} \\ &= 305 \times 0.707 \\ Q &= 215.6 \text{ gal/min} \end{aligned}$$

What is the pressure drop across an 8" (200 mm) butterfly valve that is fully open, flowing 2000 gal/min of solvent with a density of 55 lb/cu ft?

$$\begin{aligned} \Delta P &= \frac{Q^2 \times D}{C_v^2 \times 62.4} \\ &= \frac{(2000)^2 \times 55}{(3250)^2 \times 62.4} \\ \Delta P &= 0.33 \text{ psi} \end{aligned}$$

Water Hammer

Water hammer is a series of shocks in a piping system caused by rapidly stopping the flow of fluid in that system.

Although it is difficult to measure pressure spikes caused by water hammer shock with ordinary equipment, maximum obtainable pressures caused by instantaneous valve closure can be approximated by the following formula:

Pressure (max.) = interrupted velocity (fps) x 58 psi/ft/sec

In other words, pressure increases 58 psi for each ft/sec of interrupted pipeline velocity.

A pipe carrying fluid at a velocity of 15 ft/sec velocity will have an instantaneous pressure increase of 870 psi under rapid closure conditions.

The effects of water hammer are seen in a butterfly valve as bent disc and stems, a broken body or both.

Water hammer can be reduced or eliminated by slowing valve closure time in accordance with the following formula:

$$\text{time seconds} = \frac{0.14Q}{S(P)}$$

Where:

Q = flow in gal/min

S = upstream pipe size in sq ft

P = pressure rating of the valve in psi

Generally, a closing time of six to eight seconds is sufficient to eliminate water hammer.

GENERAL TECHNICAL INFORMATION (CONT.)

Cavitation Data

Liquid flow is accelerated as it passes through a valve in such a manner that pressure is decreased below the vapor pressure and bubbles form. Immediately downstream of the valve, velocity decreases while pressure increases and the bubbles collapse, causing possible mechanical damage to the valve and piping. This is called cavitation. Cavitation often can be identified by the noise of the collapsing bubbles, which sounds like gravel flowing in the pipe.

Generally, butterfly valves operate with high-flow capacities and at low-pressure differentials and are not particularly susceptible to cavitation.

When butterfly valves are used as control valves, one can ensure that cavitation will not occur by applying the following simplified formula:

$$\Delta P_{\text{max}} = K_c (P_1 - P_v)$$

Where:

ΔP_{max} = differential pressure across the valve

K_c = cavitation constant
(approximately 0.35 for butterfly valves)

P_1 = inlet pressure (psia)

P_v = vapor pressure of the flowing liquid (psia)

Example:

What is the maximum pressure drop possible through a butterfly valve at 100 psig inlet pressure with water at 68° F (0.339 psia vapor pressure)?

$$\Delta P_{\text{max}} = K_c (P_1 - P_v)$$

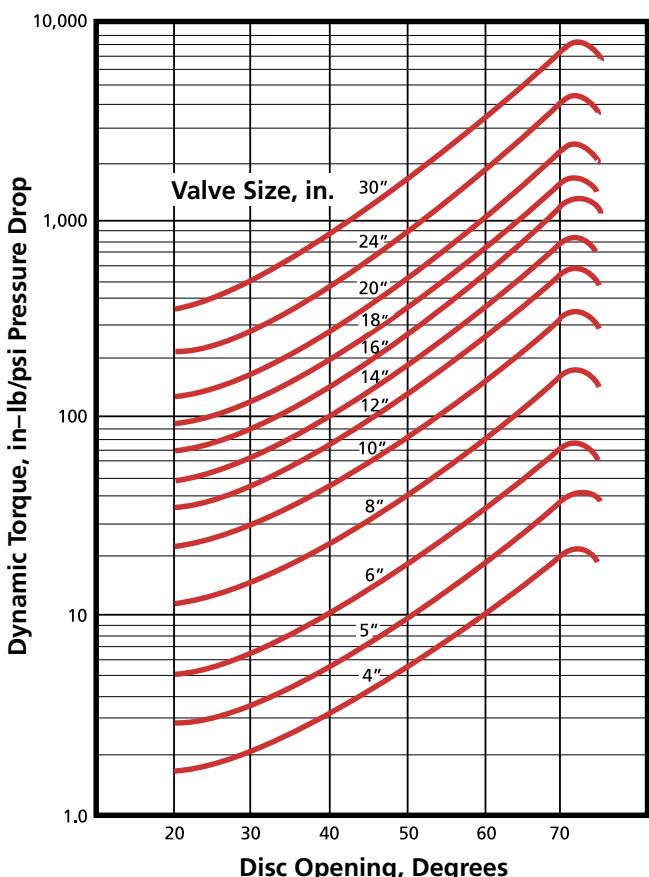

Under the above conditions, it is possible to take a 40.03-psi pressure drop across the valve before cavitation will begin.

TORQUE DATA

The torque (turning effort) required to operate a given butterfly valve is determined by two factors: friction of the disc and the seat. The interference and dynamic forces of flow through the valve tend to open or close the valve. The actuator torque output must meet or exceed the maximum torque requirement of the valve. Normal wet opening torque requirements due to interference are tabulated below. Dry service will increase opening torque significantly. Consult Cameron for dry service torque requirements.

The disc of a butterfly valve, in partially opened condition, is subject to lift forces from passage of fluid over its surfaces. This effect is analogous to an airplane wing and results in an unbalanced turning force on the disc. The dynamic torque is proportional to the pressure drop through the valve and may become significant in some applications.

Dynamic torque typically is at a maximum when the disk opening is about 70 degrees. Under high differential pressure conditions, such torque may exceed the design strength of stems, connections or actuators. The curves at right may be used to calculate dynamic torque for DEMCO butterfly valves and should be consulted in any case where high differential pressure may occur during valve operation.

* Conforms to USCG Marine requirements, as outlined in 46 C.F.R., part 56.

** See material trademark on page 40. Consult Cameron for special material requirements.

Seats vary. See pages 9, 10 and 11 for seat material description and part number scheme for available options for different valve series.

Buna-N is a general purpose elastomer compounded for maximum hydrocarbon or petroleum resistance. 0° F to 180° F (-18° C to 82° C). Same as Nitrile, Hycar* and NBR.

General Service EPDM is recommended for water service. Resistance to saturated steam up to 275° F (135° C) is superior. EPDM is suitable in alkaline solutions. EPDM is not suitable for oil or hydrocarbons. Peroxide-cured 20° F to 275° F (-6° C to 135° C).

Food Grade EPDM is formulated in compliance with FDA guidelines published in the Code of Federal Regulations, Title 21, paragraph 177.2600. This material is suitable for food service, except milk and edible oils. Peroxide-cured 20° F to 275° F (-6° C to 135° C).

Sulfur-cured -30° F to 225° F (-34° C to 107° C). Same as EPDM and Nordel*.

Black Neoprene complies with FDA guidelines and is principally recommended for food and beverage service. It is resistant to vegetable oils, brine and oxygen. 0° F to 180° F (-18° C to 82° C). Same as Polychloroprene and CPE.

White Neoprene complies with FDA guidelines and offers chemical resistance comparable to black neoprene, but it uses fillers other than carbon black to provide white coloration. Physical properties are not as good as black neoprene, and white neoprene should be used only when black cannot be tolerated. Storage should be under low light conditions to prevent discoloration. 0° F to 180° F (-18° C to 82° C).

Hypalon* is compounded for chemical resistance and is superior in acids and hydrocarbons. 0° F to 180° F (-18° C to 82° C). Same as CP.

FKM is superior at elevated temperatures and in harsh chemical environments. FKM is not suitable for hot water or steam. 20° F to 300° F (-6° C to 149° C). Same as Fluoroelastomer.

Natural Rubber generally is superior to other elastomers in abrasion resistance and is recommended for dry material handling. Use in oils and solvents is not recommended. -30° F to 150° F (-34° C to 65° C).

Fluorosteam seats offer heat and chemical resistance to hydrocarbons and hot water or saturated steam. Maximum temperature capability is dependent on fluid resistance, pressure and flow rates. 20° F to 275° F (-6° C to 135° C).

ETM-30230 is compounded to combine many of the better media properties of Buna-N, EPDM or neoprene for service in hydrocarbons, gasoline, solvents, animal oils and vegetable oils with a temperature range of -30° F to 230° F (-34° C to 110° C). Abrasion resistance is equal to Buna-N. Resistance to H₂S and CO₂ are superior to Buna-N. -30° F to 230° F (-34° C to 110° C).

NEI-T Teflon* SEAT is EPDM elastomer bonded to a virgin TFE covering. This provides an inert, aseptic non-stick surface, which is excellent for sanitary food service applications. 0° F to 50° F (-18° C to 10° C).

Other seat elastomers are available for special applications. Consult Cameron.

* See material trademark note on page 40.

MATERIAL SELECTION GUIDE

The following application is designed for use in determining the available material most likely to give satisfactory service and is not meant to imply any type warranty. However, certain factors such as temperature, concentration and combinations of chemicals may affect the fluid resistance of any material. In questionable applications, testing is always the most positive way to determine suitability. Some materials are available in certain valve sizes and series only.

For proper valve repair, use genuine DEMCO replacement parts.

Services for Valves and Actuation

WE BUILD IT. WE BACK IT.

Startup and Commissioning

Our experts understand that each project is unique. That's why Cameron's service team helps facilitate commissioning and start-up activities.

- Integrated solutions, onsite or at our global service centers
- Increased equipment and product performance
- The shortest possible trouble-free startup for your critical assets

Spare Parts and Asset Management

Cameron offers the assets and expertise to cover all aspects of valve management.

- Full inventory of quality exact OEM parts and spares
- Complete asset risk and criticality assessments
- Comprehensive inventory of your assets, including a complete recommended spare valves and parts list

Operational Support

Cameron's ability to address valve requirements in the field is a reflection of our commitment to life-of-asset support.

- Innovative asset management solutions
- Trouble-free installation, startup and operations
- Support from commission to operation – extending through all phases of a valve's life cycle
- Extensive inventory of spare valves and parts

Cameron's site management team helps mitigate the risk of project delays by identifying issues in the construction process prior to valve installation to ensure valve integrity.
