

Valbart
**API 6D & 6A Trunnion Mounted
Side Entry, Welded Body, & Top Entry Ball Valves**

Experience In Motion

Flowserve Valbart Main Office

Flowserve Valbart Engineering Office

Profile

Valbart was founded in 2003 as a joint venture. Since then, the company has witnessed tremendous growth and has been recognized as the fastest growing firm in its sector.

Acquired in 2010 by Flowserve Corporation following a long period of sustained growth, Valbart further expanded its technical resources and product offerings.

The company specializes in designing and manufacturing API 6A and API 6D Trunnion Mounted ball Valves. The company is driven by constant innovation to increase its existing range of products. Apart from being one of the leading suppliers of TMBV, Valbart is also recognized for its production of Trunnion Mounted Control Ball Valves, Cryogenic Valves, Twin Ball Double Block & Bleed Valves and Rising Stem Friction Free Ball Valves.

The technical know-how, design and experience in producing TMBV's are Valbart's strongest assets. The company continuously improves and builds on these assets. The employment of highly talented and experienced professionals in key technical management positions is proof of the Company's commitment to a continuous improvement.

With a highly equipped facility distributed in four buildings with a total internal area of 18,000 sqm (194,000 sq. ft), Valbart aims at continuing to produce and provide valves of the highest quality and with a growth reflecting the one experienced so far.

Manufacturing capabilities

Flowserve Valbart, located in Mezzago, Italy, is a world leader in industrial valve manufacturing, and a group of professional engineers with long standing experience in ball valve design and manufacturing.

R&D department

Flowserve Valbart's R&D facilities provide the company with extensive testing capabilities such as qualification tests to determine reliability and service life under critical operating conditions and pressure testing in accordance with the ASME code as well as the other industry standards (see page 32 for details).

In-house capabilities

We have a machining and welding shop in house.

The welding facility is equipped with hi-tech SAW robots operated by fully qualified welders.

The NDT examinations of the weld bevels and beams are carried out by our qualified QC personnel using our own ultrasonic, magnetic particle, and dye penetrant equipment.

Certification and approvals

The quality program is fully compliant with the industry's most stringent standards.

Valbart holds API 6A, API 6D and API 6DSS certification and is authorized to use the official API monogram under API Spec Q1 for all of its manufactured products.

Inventory of finished components

Flowserve Valbart facilities have inventory of finished components stored in our workshop facility that are identified with a code number.

The storage area will keep expanding along with our company's growth.

Valbart In-house testing rigs and facilities

In-house testing facilities for valves up to 1600 mm (64")

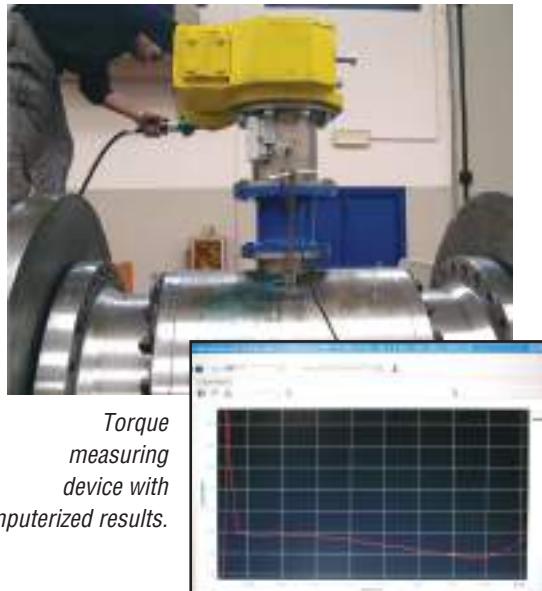

Engineered solutions

Flowserve Valbart has a strong Engineering Design Group with extensive experience in critical applications and hands-on expertise using advanced software and technology that meet the most demanding performance requirements.

Our R&D and testing facilities enable us to run the most comprehensive testing programs and accommodate valves up to 64" (1600 mm) in diameter and 40 tons in weight. In addition, given our proximity to major university and testing laboratories, we're well positioned to handle any extremely specialized tests – such as the hyperbaric test for sub-sea valves – that cannot be done in house.

*Cryogenic testing on a 16" (400 mm)
Class 1500 Top Entry Ball Valve*

*Torque
measuring
device with
computerized results.*

*Hydraulic Shell & Seat Test
on a 18" (450 mm)
Class 2500 Up-rated valve*

*Hyperbaric testing through
external subcontractor*

High temperature valve testing

High Pressure System for Gas Testing

Machinery and equipment

Our production equipment uses the latest automation technology and is specially engineered to meet the requirements of advanced large valve manufacturing.

This includes large CNC horizontal and vertical boring mills with tool changers, NC lathes, and NC machining centers for valve bodies and parts. Valbart has qualified procedures, welders, and welding operators for all major weld processes.

The production testing equipment is designed to safely and efficiently test 100% of the current production of low- and high-pressure valves in strict accordance with industry codes and standards, as well as customer-imposed criteria.

Valbart's standard trunnion-mounted ball valves offer increased value by incorporating advanced design features.

Valbart trunnion-mounted ball valve design features

1 Independent ball and stem

The ball and stem are independent to minimize the effect of the side thrust generated by the pressure acting on the ball.

2 Trunnion-mounted ball

The ball is fixed and the seat rings are floating, free to move along the valve axis.

Side load generated by the pressure acting on the ball is absorbed by bearings.

At low pressure, the seat sealing action is achieved by the thrust of the springs acting on the seat rings.

As the pressure increases, the fluid pressure pushes the seat rings against the ball.

3 Anti-blowout stem

Stem is retained by the stem cover (other designs available on request).

4 Anti-static design

The electrical continuity between all the metallic components is guaranteed and certified.

5 Floating self-relieving seat rings

Two independent floating seat rings assure the bi-directional tightness of the valve. The seats are carefully designed to

minimize the torque required to operate the valves without losing sealing power, which is assured from zero differential pressure to the valve's maximum rated pressure.

Self-relieving seats are supplied as a standard feature.

Double piston or combination seats (self-relieving/upstream, double piston/down-stream) can be supplied upon request.

6 Emergency sealant injection

Each valve is supplied complete with emergency sealant injection feature located between the upper O-rings and the graphite gasket.

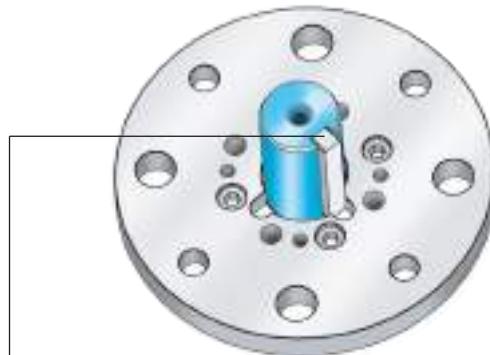

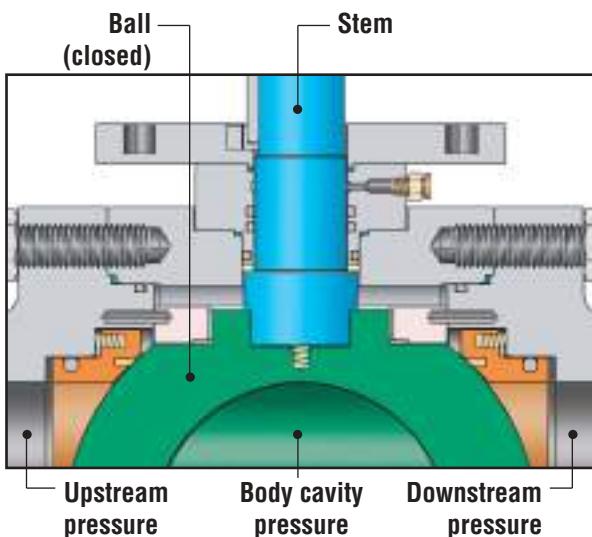

An emergency sealant injection feature on seats is available upon request only, for 6" full port and larger.

Emergency grease injection features are not recommended on low-and high-temperature valves.

Low emission valves

Accurate machining of stem and bonnet sealing surfaces ensures compliance with the most severe pollution-control regulations.

Ball seat alignment

Mechanical stops ensure control over ball rotation.

Double Block and Bleed

All Valbart trunnion-mounted ball valves are designed and manufactured to seal off both seats at the same time and allow bleeding of the entrapped cavity pressure (DBB) with the ball in the closed position to verify that the seats are sealing properly.

Both seats hold their respective pressures independent of the body cavity pressure. The double block and bleed feature makes it possible to do such things as flush the valve under pressure and verify that the seats are sealing properly.

Stem Sealing

Stem sealing is ensured by two o-rings, while the top graphite gasket ensures fire resistance.

The graphite gasket can be replaced while the valve is under pressure, provided that the ball is in the fully closed position with the body cavity vented.

With no pressure in line, it is also possible to remove the gland plate for replacement of the two o-rings

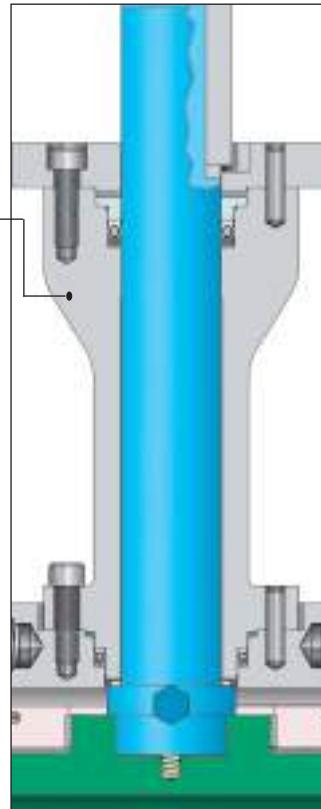

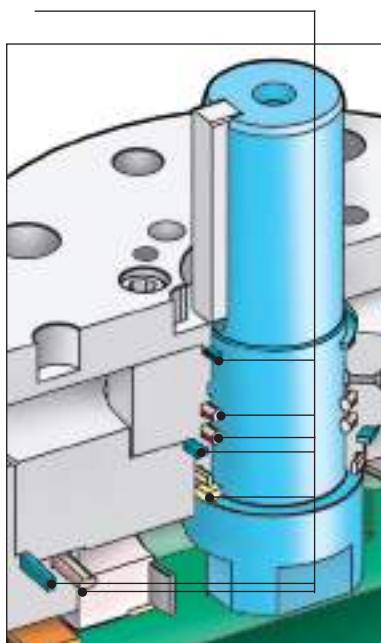

Body Sealing

The double sealing action of O-rings and graphite gaskets in all the static joints of the body components ensures zero leakage and the Fire Safe feature.

Extended Bonnet

Valve designs are available with extended bonnets for applications in extreme temperature service.

Extended bonnets are recommended for service at temperatures below -50°C (-58°F) or above 220°C (428°F).

Soft-seated valves (primary metal, secondary soft)

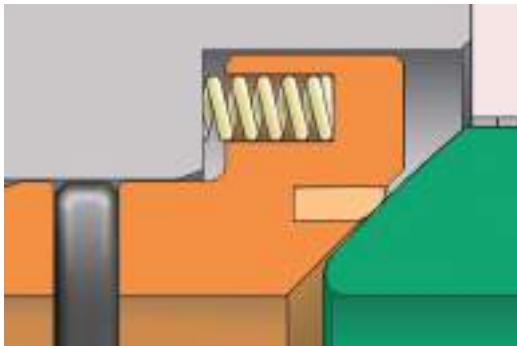

Figure 1 – Soft seat with thermoplastic insert

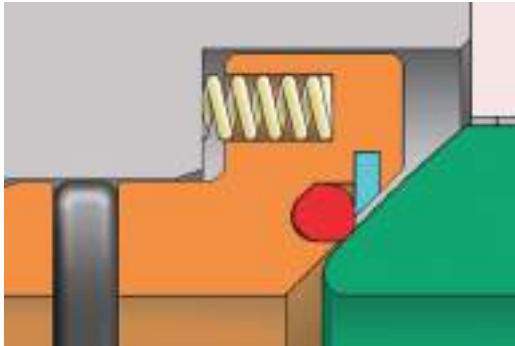

Figure 2 – Soft seat with elastomer (Primary metal secondary soft)

In standard services, soft seats are used. The soft sealing between the seats and the ball is obtained with a thermoplastic insert (figure 1) or an elastomeric o-ring (figure 2). While the thermoplastic design (figure 1) is a fully soft contact, the elastomeric design (figure 2) grants a primary metal secondary soft seal.

Metal-seated valves

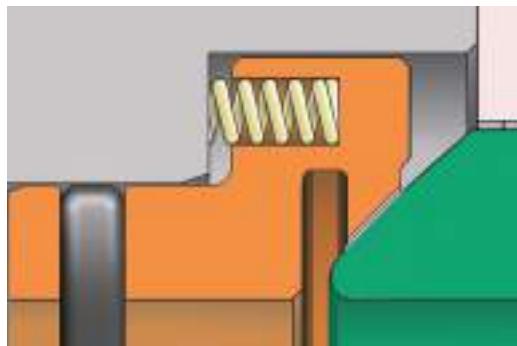

Figure 3 – Metal to metal seat

Whenever soft seat is no longer suitable due to high temperature, chemically aggressive media or dirty services, the contact area between the seats and the ball can be completely metal to metal. This is obtained by coating ball and seats with tungsten carbide, chrome carbide or ENP. Other coatings are available on request.

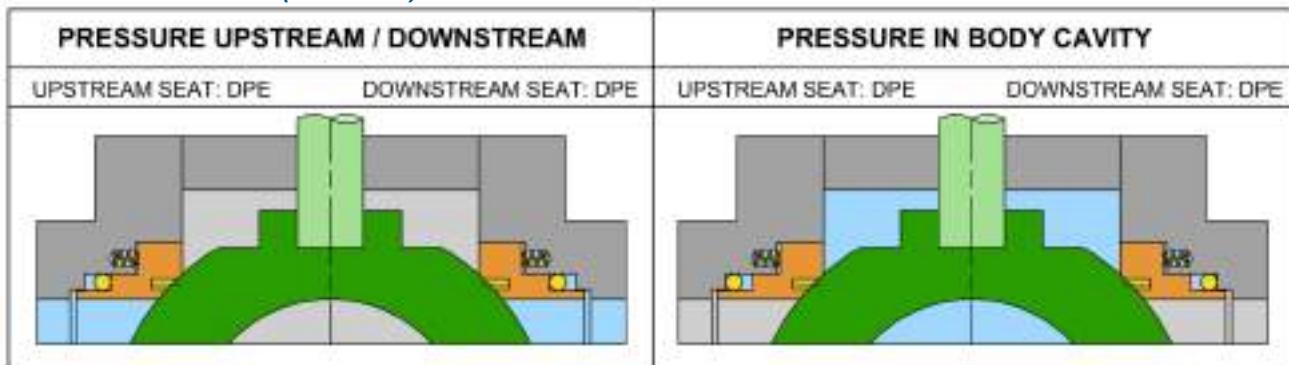

Standard Seat Configuration Single Piston Effect (SPE-SPE)

PRESSURE UPSTREAM / DOWNSTREAM			
UPSTREAM SEAT: SPE	DOWNSTREAM SEAT: SPE	UPSTREAM SEAT: SPE	DOWNSTREAM SEAT: SPE
When pressure acts from upstream/downstream side, SPE seats are pushed against the ball by the piston effect, ensuring tight shutoff.	When pressure acts from body cavity, SPE seats are designed to be pushed away from the ball, relieving cavity pressure in line.	For such reason, SPE seats are also known as "self relieving". With SPE-SPE configurations, cavity relief always takes place through lower pressure side.	

When pressure acts from upstream/downstream side, SPE seats are pushed against the ball by the piston effect, ensuring tight shutoff. When pressure acts from body cavity, SPE seats are designed to be pushed away from the ball, relieving cavity pressure in line. For such reason, SPE seats are also known as "self relieving". With SPE-SPE configurations, cavity relief always takes place through lower pressure side.

Typical application: Pipeline ball valves in liquid services, to prevent pressure buildup in body cavity due to change in temperatures

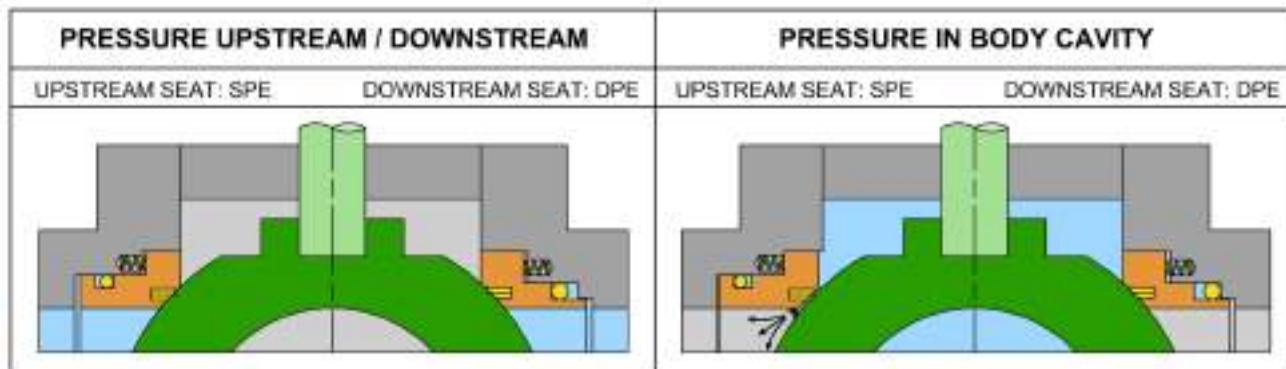

**Optional Seat Configuration
Double Piston Effect (DPE-DPE)**

DPE seats are designed to be pushed against the ball in both cases, whether pressure comes from body cavity or from upstream/downstream side. Valve with DPE seats cannot perform cavity relief. For such reason -in liquid services- the use of a relief valve is recommended.

Typical application: Whenever it is necessary to create an additional safe barrier between the upstream and the downstream sides. Recommended in welded body valves, where seats maintenance is not foreseen.

**Optional Seat Configuration
Combined SPE-DPE**

Upstream SPE seat ensures self relieving capability, while downstream DPE seat grants the double barrier in case of upstream seat damage. This configuration involves a preferred direction of installation with SPE seat facing upstream. With SPE-DPE configurations, cavity relief always takes place through SPE seat.

Typical application: Riser valves, pig launchers/receivers. DPE seat gives double isolation to the pig trap, allowing automatic relief of body cavity at the same time in case of pressure buildup

Fire safe

Valbart trunnion-mounted ball valves are designed and certified Fire Safe to API 6FA, API 607, and ISO 10497.

Extended stem

Valves installed underground or in remote locations can be operated with an optional extended stem.

All the drain, vent, and emergency sealant connections can be operated using extended connecting pipes firmly attached to the stem protective cover.

Ends

Valve ends can be manufactured to several configurations to comply with customer requests, such as:

Flanged RF or RTJ to ASME B16.5 up to 24" (MSS SP-44 for 22") and B16.47A for 26" and larger. Other flange designs are available on request.

Butt-weld ends to ASME B16.25. Others types of weld ends are available upon request.

Hub ends for clamped connections are available as per customer specification.

Actuation

Hand-operated valves are supplied either with a lever or gear operator.

The use of a wrench is limited to valves equal to or smaller than:

- 4" – Class 150 • 4" – Class 300
- 3" – Class 600 • 3" – Class 900
- 2" – Class 1500 • 1" – Class 2500

Actuated valves can be supplied with:

- Electric actuators
- Pneumatic actuators
- Hydraulic actuators
- Gas over oil actuators for ESDV, SDV, BDV, MOV, GOV, and HIPPS services

Actuated valves for testing in the in-house valve automation centre

Mounting operators valve automation center

Operator mounting should be made at the Valbart Valve Automation Center before shipment.

If the operators will be assembled on site, the mounting will be carried out before installing the valves in line, following Valbart instructions.

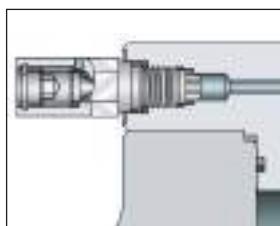

Mounting of operators on valves already installed in line is not recommended and will be performed only under the supervision of Valbart.

Operator mounting flanges are in accordance with ISO 5211-FF.

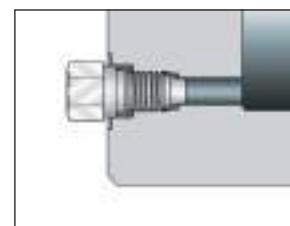

Vent valve and drain plug

Each valve 6" and larger is supplied complete with a 1/2" NPT vent valve located in the upper part of the body and complete with a drain plug located in the lower part of the body.

Each valve 6 x 4" and smaller is supplied complete with a 1/2" NPT vent/drain valve located in the lower part of the body.

 Face to face dimensions not listed in industry standards may be subject to change without notice.

API 6D & 6A trunnion-mounted ball valves

Bolted body side entry • Welded body • Top entry

24" (600 mm) Class 2500 Side Entry Valve
with special vent & drain connections

48" (1200 mm) Class 600 valve
with Electrohydraulic actuator

11" (250 mm) Class 10000
API 6A Ball Valve

24" (600 mm) Class 1500 Ball Valves with
Gas Over Oil actuators

24" (600 mm) class 1500 side-entry

56" (1400 mm) Fully Welded,
Class 600 valve

56" (1400 mm) Fully Welded valve

36" (900 mm) class 600
top-entry ball valves

34" Class 1500 Top Entry Ball Valve

20" (500 mm) class 300 side entry valves

GOV Actuated bolted body
valves with RF and BW ends
with pup piece

Engineered products for specialized applications

Control ball valve • Rising stem ball valve • Twin ball double block & bleed • Cryogenic • Subsea

24" (600 mm) Class 900# Top Entry Ball valve for Cryogenic service

12" (300 mm) Class 1500 Twin Ball Double Block & Bleed Valve

48" (1200 mm) class 300 ball valve for subsea service

20" (500 mm) Class 600 Twin Ball, Double Block & Bleed Valve

16" (400 mm) Class 600 Actuated Rising Stem Ball Valves

30" (750 mm) Class 600 Trunnion Control Ball Valve

30" (750 mm) Class 300 actuated control ball valve with anti cavitation trim

16" (400 mm) Class 900 Actuated Rising Stem Ball Valves

10" (250 mm) Class 150 actuated control ball valve with noise reduction trim

Engineering data

Valve testing

100% of valves manufactured by Valbart are tested in excess of API 6D requirements, prior to shipping.

LEAKAGE RATES

ISO 5208 SEAT LEAKAGE RATES AS PER API 6D	Seat Test Type		
	HP Hydrostatic @1.1 rating pressure	LP Pneumatic @ 6 bars	HP Gas @ 1.1 rating pressure
Soft Seated valves	Rate A	Rate A	Rate B
Metal Seated valves	Rate D	Rate B	Rate D

Above mentioned leakage rates are standard. More stringent requirements are achievable upon request.

TESTING PRESSURES

ASME CLASS	Rating ⁽¹⁾			Body Test			H.P. seat test			Air Seat Test		
	psi	bar	kg/cm ²	psi	bar	kg/cm ²	psi	bar	kg/cm ²	psi	bar	kg/cm ²

11e	Trunnion O-ring	(2)	(3)	Not applicable		Not applicable	Not applicable

NOTES: (1) Reference to nominal port size - (2) One set per 10 valves - (3) One set per 1 valve

How to avoid problems

- Ball valves should be transported and stored with the ball in the fully open position
- Flanged ends and welded ends should be protected
- End protection should be removed only when the valve is installed in the line
- Valves should be handled using the proper lifting lugs
- Valves should be stored according to Valbart storage procedures. Long-term storage should be avoided
- In case of long storage, valves should be flushed and cycled a few times
- For welded-end valves, Valbart should be informed of any post-weld heat treatment (transition pups may be necessary to avoid damages to seals)
- The line should be flushed and cleaned before valve operation
- Make sure no line-testing fluid is left in the line and/or the valve body
- Avoid leaving the valve body filled with salt water to prevent internal corrosion
- During line-testing, valves will be left in the partially open position for the minimum possible amount of time
- Standard ball valves will be used for on-off service only. Throttling service (use of the valve with the ball partially open) can damage the seats
- Actual service conditions should be taken into consideration while selecting materials for O-rings and seat inserts
- Always specify anti-explosive decompression material for valves to be used in high-pressure gas service
- Make sure the selected actuator has been properly sized (an oversized actuator can be as dangerous as an undersized one)
- Advise Valbart of cycle frequency to ensure proper sizing of actuator
- Do not use the actuator to lift the valve
